Van Dongen, M., A.G. Tomkins & R.F. Weinberg (2007)- Trace element remobilization at the Ok Tedi porphyry Cu-Au deposit, Papua New Guinea. In: C.J. Andrew et al. (eds.) Digging deeper, Proc. 9th Biennial Meeting Society for Geology Applied to Mineral Deposits (SGA), Dublin 2007, p. 427-430.
(online at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.513.3434&rep=rep1&type=pdf)
(Geochemistry of Ok Tedi porphyry copper-gold deposit and nearby Mount Ian Complex in western PNG foldbelt. Original magmatic signatures lost due to intense alteration. Large part of sulphur in system may be provided by mafic magma replenishment)

Van Dongen, M., R.F. Weinberg & R.A. Armstrong (2008)- REE-Y, Ti, and P remobilization in magmatic rocks by hydrothermal alteration during Cu-Au deposit formation. Economic Geology 105, p. 763-776.
(Whole-rock trace-element and REE patterns of samples from Ok Tedi porphyry copper-gold deposit, PNG)

Van Dongen, M., R.F. Weinberg & A.G. Tomkins (2013)- Grade distribution of the giant Ok Tedi Cu-Au deposit, Papua New Guinea. Economic Geology 108, 7, p. 1773-1781.
(Ok Tedi porphyry Cu-Au deposit in PNG world-class mineral deposit in foldbelt near W Papua border. With 5.5 Mt Cu and 18.1 Moz Au. Skarn accounts for ~80% of resources. Two composite felsic intrusions in clastics and carbonates at ~1.16 Ma, in postcollisional tectonic setting, with magmatic-hydrothermal mineralization within ~200 k.y. Contrasting styles of mineralization, conform to classic skarn (where limestone present at depth) and porphyry-type mineralization (where impermeable siltstone present) (see also Pollard 2014))

Van Dongen, M., R.F. Weinberg, A.G. Tomkins & R.A. Armstrong (2008)- Timescale of forming a giant porphyry copper-gold deposit- Ok Tedi, Papua New Guinea. PACRIM Congress 2008, p. 1-4.
(U-Pb dating of zircon at giant Ok Tedi porphyry copper-gold deposit show maximum age of intrusions that host mineralisation is 1.43 ± 0.2 Ma. Previous K-Ar dates constrained last thermal event at 1.11 Ma)

Van Dongen, M., R.F. Weinberg, A.G. Tomkins, R.A. Armstrong & J.D. Woodhead (2010)- Recycling of Proterozoic crust in Pleistocene juvenile magma and rapid formation of the Ok Tedi porphyry Cu-Au deposit, Papua New Guinea. Lithos 114, p. 282-292.
(preprint online at: https://users.monash.edu.au/~weinberg/PDF_Papers/VanDongen_LITHOS.pdf)
(Zircon from monzonite with U-Pb crystallisation ages of 1.16 Ma, making Ok Tedi youngest known giant porphyry copper-gold deposit. Mineralisation lasted <~0.5 Myr. Pleistocene zircons with inherited Proterozoic component of ~1.8-1.9 Ga. Cores with crustal oxygen isotopic signature, suggesting assimilation of Proterozoic continental crust by mantle-derived magma, similar to Pliocene Porgera Au deposit. Proterozoic ages compare to felsic magmatic rocks on mainland N Australia, in particular Mount Isa inlier)

Van Oyen, F.H. (1972)- Trough evidence along the southern foothills of the Prince Alexander Mountains (Sepik area of New Guinea). Australian Petroleum Exploration Assoc. (APEA) Journal 12, 2, p. 74-78.
(Identification of significant Neogene sediment thickness in North PNG Sepik Basin from magnetic survey)

Van Wyck, N. & I.S. Williams (2002)- Age and provenance of basement metasediments from the Kubor and Bena Bena blocks, central Highlands, Papua New Guinea: constraints on the tectonic evolution of the northern Australian cratonic margin. Australian J. Earth Sciences 49, p. 565-577.
(Metamorphics in Kubor/ Bena Bena blocks in PNG Central Highlands with old detrital zircons, suggesting N Australian provenance. Ages of ~1.8 Ga (10%), ~1.55 Ga (10%), 470-440 Ma (Late Ordovician; 15%), ~340 Ma (E Carboniferous; 10%) and 290-260 Ma (E-M Permian; 40%) match zircons from Coen Inlier, NE Queensland, but contrast with ages from terranes further S, E and W. Omong Metamorphics protolith probably deposited in M-L Permian, deformed in Late Permian- E Triassic, intruded by E Triassic Kubor Intrusive Complex at ~245, 239 Ma)

(online at: https://nla.gov.au/nla.obj-2722625441/view?partId=nla.obj-2724974539page/n0/mode/1up)
(Includes evidence of oil along coastal belt 8-12 miles wide between Purari River Delta and Yule Island.)

Wade, A. (1927)- The search for oil in New Guinea. American Assoc. Petroleum Geol. (AAPG) Bull. 11, 2, p. 157-176.
(Early overview of geography, geology, oil seeps and oil exploration activity in W and E New Guinea, where at that time no commercial production had yet been established. First gas seeps discovered at Upoia/ Opa, 30 miles from mouth of Vailala River, also site of first hydrocarbon exploration well drilled in PNG side in 1915, which produced a few 1000 gallons of light oil from a shallow well in the Vailala area)

Wai, K.M., M.J. Abbott & A.E. Grady (1994)- The Sadowa Igneous Complex, eastern Papua: ophiolite or not. Mineralogical Magazine 58, p. 949-950.
(online at: http://rruff.info/doclib/MinMag/Volume_58A/58A-2-949.pdf)
(Extended Abstract Goldschmidt Conference 1994. Late Cretaceous- Eocene Sadowa Igneous Complex, E PNG, obducted onto Owen Stanley metamorphics in Late Eocene- M Oligocene to form E Papuan Composite Terrane. With plagiogranites similar to those from back arc basin rather than oceanic ridge. Sadowa Igneous Complex not complete ideal ophiolite sequence, but still similar to ophiolites elsewhere)

Walker, D.A. & W.E. Cameron (1983)- Boninite primary magmas: evidence from the Cape Vogel Peninsula, PNG. Contributions to Mineralogy and Petrology 83, p. 150-158
(Boninites from Cape Vogel, PNG, mainly pyroxene-glass rocks, but many contain olivine. Parental magma probably formed at 1250- 1300° C and low P (<?10kB), similar to olivine-clinoenstatite phyric boninites from New Caledonia and Howqua, Australia)

Walker, D.A. & I. McDougall (1982)- ^{40}Ar ^{39}Ar and K-Ar dating of altered glassy volcanic rocks: the Dabi Volcanics, P.N.G. Geochimica Cosmochimica Acta 46, 11, p. 2181-2190.
(Ar/Ar adiometric ages for altered submarine tholeiitic and boninite (high-Mg andesite) lavas from Dabi Volcanics, Cape Vogel Peninsula, Papua New Guinea, suggest Late Paleocene age (~59 Ma) for tholeiitic and boninitic lavas, while apparent K/Ar ages for same samples range from ~27.2- 64 Ma, probably due to variable radiogenic 40Ar loss)

Wang, S., C. Xu, Z. Li, Y. Wen & C. Song (2020)- The 2018 Mw 7.5 Papua New Guinea Earthquake: A possible complex multiple faults failure event with deep-seated reverse faulting. Earth and Space Science 7, 3, e2019EA000966, p. 1-9.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/pdf/10.1029/2019EA000966)
(25 February 2018 devastating Mw 7.5 earthquake across S area of Papuan fold-thrust belt. Involved multiple faults, dominated by reverse fault motion, and slip of up to ~0.7 m on faults extending to >25 km depth)

Waples, D.W. & K.J. Wulff (1996)- Genetic classification and exploration significance of oils and seeps of the Papuan Basin. In: P.G. Buchanan (ed.) Petroleum exploration and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 417-430.
(137 oil samples classified into 5 families from different Mesozoic- Tertiary sources. Four of the oil families in linear trends in Papuan Fold Belt. Family 3 oils tied to oil in Oxfordian sands. Family 1 oils with oleanane and bicadanes probably from Oligocene or younger rocks (only in seeps in SE). Family 2 oils with oleanane but no bicadanes probably from U Cretaceous or Paleogene source. Families 3-4 no oleananes, analogous to NW Shelf Mesozoic sources (in Papuan fold belt oil-gas fields))

Warburton, J., J. Iwanec, J. Lamb, D. Waples & K. Wulff (2017)- Potential for future petroleum resource growth in PNG. Proc. SE Asia Petroleum Exploration Society (SEAPEX) Exploration Conference 2017, Singapore, Session 6, p. 1-24. *(Abstract + Presentation)*
(Oil Search 2015 assessment determined ~4.8 GBOE recoverable resources discovered in PNG to date (85% gas). Additional 7 GBOE still to be discovered (40 TCF gas + 550 MMbarrels). In parts of interior PNG petroleum generated in Late Cretaceous, predating foldbelt. In other areas petroleum generated during Mio-Pliocene foldbelt formation near present-day mountain front where it continues to be generated today)

Warren, R.G. (1972)- A commentary on the metallogenic map of Australia and Papua New Guinea. Bureau Mineral Resources (BMR), Canberra, Bull. 145, p. 1-85.
(online at: https://www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=99)
(Includes 1:1.5M scale map and brief review (p. 69-73) of PNG mineral occurrences)

Waterhouse, H.K. (1996)- Potential of palynostratigraphy for Neogene basin analysis in Papua New Guinea. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 329-343.
(Palynostratigraphy of U Miocene- Lower Pliocene Orubadi Fm in Puri anticline of Papuan foreland basin. Several episodes of reworking of M Cretaceous- Miocene dinoflagellates from New Guinea Highlands)

Waterhouse, H.K. (1998)- Palynological fluorescence in hinterland reconstruction of a cyclic shallowing-up sequence, Pliocene, Papua New Guinea. Palaeogeogr. Palaeoclim. Palaeoecology 139, 1-2, p. 59-82.
(Variations in fluorescence of contemporaneous Pliocene and lower-fluorescent reworked palynological particles in shallowing-upward sequence of Lower Pliocene Orubadi Fm in Puri Anticline of Papuan Foreland Basin. Episodes of reworking in Puri Creek shown by nannofossils (Late Cretaceous, Late Paleocene, Oligocene-Miocene boundary, M-L Miocene) and palynomorphs (Cenomanian, Senonian), result of episodes of thrusting in New Guinea foldbelt)

Watmuff, G. (1978)- Geology and alteration-mineralization zoning in the central portion of the Yandera porphyry copper prospect, Papua New Guinea. Economic Geology 73, p. 829-856.
(Copper mineralization at Yandera in PNG central highlands associated with low-K tholeiite-calc-alkaline porphyry intrusives into M Miocene (13.5 Ma) Bismark Intrusive Complex. Three episodes of porphyry emplacement. Oldest and largest porphyry emplaced ~1 Myrs after intrusion of host Bismarck batholith)

Webb, P.K. & P. Woyengu (1999)- The internal fold and thrust belt play, Papua New Guinea. In: C.A. Caughey & J.V.C. Howes (eds.) Proc. Conference Gas habitats of SE Asia and Australasia, Jakarta 1998, Indonesian Petroleum Association (IPA), Jakarta, p. 213-224.
(Brief overview of 600 km long x 230 km wide PNG foldbelt. Three segments, two trending NNW, middle one NW. Folding, thrusting, and uplift since Late Miocene)

Webber, S., K.P. Norton, T.A.Little, L.M. Wallace & S. Ellis. (2018)- How fast can low-angle normal faults slip? Insights from cosmogenic exposure dating of the active Mai'iu fault, Papua New Guinea. Geology (GSA) 46, 3, p. 227-230.

Webber, S., T.A. Little, C. Boulton, J. Biemiller & M. Mizera (2022)- Regional-scale low-angle normal fault friction and cohesion constrained from Mohr-Coulomb models of active and abandoned Range-Front faults in Papua New Guinea. J. of Geophysical Research: Solid Earth 127, e2021JB023553, p. 1-23.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2021JB023553)
(Modeling of Gwoira rider block, located atop fast-slipping Mai'iu low-angle normal fault (LANF), Woodlark Rift, SE PNG, indicates fault segment is frictionally weak. Model for initiation and evolution of rider blocks: (1) LANF initiates at moderately steep dip; (2) exhumed LANF footwall uplifted and back-rotated (rolling-hinge); (3) at some point upper part of LANF dips at such shallow angle that new high-angle fault cuts LANF hanging-wall, creating new rider block. (4) rider block uplifted and back rotated with further slip on LANF))

Webber, S., T. Little, K. Norton, J. Osterle, M. Mizera, D. Seward & G. Holden (2020)- Progressive back-warping of a rider block atop an actively exhuming, continental low-angle normal fault. J. Structural Geology 130, 103906, p. 1-15.
(Although Mai'iu fault in SE PNG still active in W, to E it dips 15-22° at surface, and has been abandoned in favor of younger, ~42° dipping Gwoira fault. Fault abandonment caused part of former hanging wall to be captured by footwall. Rider block structure records progressive shallowing of Mai'iu fault concurrent with slip. inception of Mai'iu fault before 3-6 Ma, and inception of Gwoira fault between 2.3 and 5.6 Ma.Continental Low Angle Normal Faults initiate at moderate dips, and evolve according to 'rolling-hinge' process)

Webber, S., K.P. Norton, T.A. Little, L.M. Wallace & S. Ellis (2018)- How fast can low-angle normal faults slip? Insights from cosmogenic exposure dating of the active Mai'iu fault, Papua New Guinea. Geology (GSA) 46, 3, p. 227-230.
(Mai'iu fault in rapidly extending Woodlark Rift is one of few active continental low-angle normal faults globally. Such faults may slip at >10-20 mm/yr faster than high-angle normal faults. Cosmogenic nuclide exposure dating (10Be in quartz) of Mai'iu fault scarp indicates slip at 11.7 ± 3.5 mm/yr over past ~5.5 k.y.)

Weiler, P.D. (1999)- Paleomagnetic study of an active arc-continent collision, Finisterre Arc Terrane, Papua New Guinea. Ph.D. Thesis University of California, Santa Cruz, p. 1-183.
(Larger scale paleomagnetic results from colliding Finisterre Arc: hemipelagic rocks indicate CW rotation of colliding terrane of ~40° in post-Miocene time. Decreasing paleomagnetic declination anomalies along strike in Finisterre Terrane, suggesting rotation results from rigid-body rotation of FT rather than sequential docking of colliding blocks)

Weiler, P.D. & R.S. Coe (1997)- Paleomagnetic evidence for rapid vertical-axis rotations during thrusting in active collision zone, northeastern Papua New Guinea. Tectonics 16, 3, p. 537-550.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/97TC00493)
(Three thrust sheets of foldbelt N of Ramu-Markham fault zone rapid CCW rotations in last 1 My, related to tectonic transport)

Weiler, P.D. & R.S. Coe (2000)- Rotations in the actively colliding Finisterre Arc Terrane: paleomagnetic constraints on Plio-Pleistocene evolution of the South Bismarck microplate, Northeastern Papua New Guinea. Tectonophysics 316, p. 297-325.
(Paleomagnetic results from actively colliding Finisterre Arc Terrane in N PNG indicate ~40° post-Miocene clockwise rotation of colliding terrane. Rotation reflects coherent rigid rotation of Finisterre Terrane rather than sequential docking of independently colliding blocks. S Bismarck/ Australia relative motion highly oblique collision in early stages, with Finisterre Arc Terrane converging along left-lateral Ramu-Markham suture, gradually changing to nearly orthogonal convergence observed today)

Weiser, T.W. & H.G. Bachmann (1999)- Platinum-group minerals from the Aikora River area, Papua New Guinea. The Canadian Mineralogist 37, p. 1131-1145.
(online at: http://rruff.info/doclib/cm/vol37/CM37_1131.pdf)
(Platinum-group minerals discovered in placers in Aikora River, derived from ophiolites of Papuan Ultramafic Belt of E PNG. Mainly Os-Ir-Ru alloys (88%) and minor Pt-Fe alloy)

Welsh, A. (1990)- Applied Mesozoic biostratigraphy in the Western Papuan Basin. In: G.J. & Z. Carman (eds.) Petroleum exploration in Papua New Guinea, First PNG Petroleum Convention, Port Moresby, p. 369-380.
(BP Jurassic-Cretaceous palynology zonation of PNG LateJurassic- mid-Cretaceous section. A modified version of Helby et al. 1987 and Davey 1987 zonations. With PNG chronostratigraphic diagram)

Whalen, J.B., R.M. Britten & I. McDougall (1982)- Geochronology and geochemistry of the Frieda River prospect area, Papua New Guinea. Economic Geology 77, 3, p. 592-616.
(Intrusive and volcanic rocks of Frieda River prospect between Frieda and Lagaip fault zones of New Guinea Mobile Belt in W Sepik District all of andesitic composition and belong to normal K calc-alkaline suite. Frieda Complex is remnant edifice of island stratovolcano interstratified in M Miocene Wogamush Fm. with copper-gold and porphyry copper deposits along central axis of complex. Mianmin area is separate, unmineralized volcanic center. Nena Diorite N of Frieda Complex intrudes Upper Cretaceous- Eocene basement rocks, with igneous activity dated between ~17.3- 11.2 Ma)

Whattam, S.A., J. Malpas, J.R. Ali & I.E.M. Smith (2008)- New SW Pacific tectonic model: cyclical intra-oceanic magmatic arc construction and near-coeval emplacement along the Australia-Pacific margin in the Cenozoic. Geochem. Geophysics Geosystems G3 9, 3, p. 1-34.
(NE dipping subduction established off PNG by at least 65-60 Ma which resulted in emplacement of Papuan Ultramafic Belt (PUB) ophiolite at 59-58 Ma. PUB formed above NE dipping Cenozoic intraoceanic arc system which diachronously propagated (N-S) along E margin of Australian Plate. These 'infant arc' ophiolites represent fragments of supra-subduction zone lithosphere generated in earliest stages of magmatic arc formation, emplaced shortly after (<20 My) as result of forearc-Australian Plate collision. Subduction inception result of subsidence of older MORB-like lithosphere generated in extensive back arc basin. During emplacement of each ophiolite, a crustal fragment of older lithosphere was scraped off NE dipping slab and subsequently back-thrust beneath each ophiolite during emplacement)

Whitford, D.J, T.L. Allan, A.S. Andrew, S.J. Craven, P.J. Hamilton, M.J. Korsch et al. (1996)- Strontium isotope chronostratigraphy and geochemistry of the Darai Limestone: Juha 1X well, Papua New Guinea. In: P.G. Buchanan (ed.) Petroleum exploration, development and production in Papua New Guinea, Proc. 3rd PNG Petroleum Convention, Port Moresby, p. 369-380.
(Sr ages in 1600m thick Darai Lst of Juha 1X well show age range of 7.7- 28.9 Ma (Oslick et al. 1994 calibration), in good agreement with foram ranges. Top Te1-4 (Top Borelis pygmaeus) = 24 Ma, Top Te5 (Top Spiroclypeus) near 21 Ma, Top Tf1= 14 Ma (but picked horizon above observed tops Austrotrillina, Miogypsina; JTvG), Tf2 = ~11-12 Ma. Consistent Sr-isotope ratio trend, but also number of anomalous values)

Whitford, D.J., T.L. Allan, M.J. Korsch, H. Middleton & J.A.Trotter (2003)- Strontium isotope chronostratigraphy and the carbonate sedimentation history of the Papuan Basin, Papua New Guinea Proc. 5th International Symposium Applied Isotope Geochemistry, AIG-5. Int. Association of Geochemistry Cosmochemistry (IAGC), p. 265-268.

Adiba-1 in S part of foreland similar oil geochemistry. Early Jurassic or Triassic source rock?)

Worthing, M.A. (1987)- Deerite from Papua New Guinea. Mineralogical Mag. 51, p. 689-693.
(online at: www.minersoc.org/pages/Archive-MM/Volume_51/51-363-689.pdf)
(Deerite (=hydrous iron silicate) occurrence appears to be limited to glaucophane-lawsonite schist and associated transitional facies. First occurrence in PNG in two meta-ironstones from NE PNG, near Kokoda)

Worthing, M.A. (1988)- Petrology and tectonic setting of blueschist facies metabasites from the Emo Metamorphics of Papua New Guinea. Australian J. Earth Sciences 35, p. 159-168.
(Emo Metamorphics metabasites in Kokoda area, SE PNG, contain quartz-albite-phengite- stilpnomelane-ferroglaucophane- chlorite-almandine-epidote-sphene-apatite. Similar to lawsonite-epidote transition zone on New Caledonia. Suggests P-T conditions of metamorphism of ~7.0 kbar and 320°C. Emo Metamorphics may be sliver of oceanic crust caught up in thrusting that accompanied obduction of Papuan ophiolite)

Worthing, M.A. & M.A. Bennett (1988)- Geochemistry, mineralogy and tectonic setting of deerite-bearing meta-ironstones from the Emo Metamorphics of Papua New Guinea. Australian J. Earth Sciences 35, p. 29-38.
(Deerite-bearing meta-ironstones from Emo Metamorphics of SE PNG suggests deposition as metalliferous cherts enriched in manganese and iron by hydrothermal exhalative activity in ocean ridge system)

Worthing, M.A. & A.J. Crawford (1996)- The igneous geochemistry and tectonic setting of metabasites from the Emo Metamorphics, Papua New Guinea; a record of the evolution and destruction of a backarc basin. Mineralogy and Petrology 58, p. 79-100.
(Papuan ophiolite outcrops in 400km x 40km wide belt on NE side of Owen Stanley Range in Papuan Peninsula. Ophiolite complex, dipping NE at ~20° and is continuous with mantle and crust underlying SW Solomon Sea. Metabasites from Emo Metamorphics in thrust sheets below Papuan ophiolite, and derived mainly from basalt, gabbro, etc. (tholeiitic and back-arc basaltss). Four groups: garnet blueschists with glaucophane, amphibolites, lawsonite blueschists and greenschists. Most samples polymetamorphic history. Two new 39Ar-40Ar isochron ages of amphibolites: ~32-35Ma (= E Oligocene age of obduction of opholite after collision with Owen Stanley microcontinental terrane) and ~14.8 Ma (=M-Miocene arc-continent collision with continental crust of E and Papuan Plateaus of N Australian plate?))

Worthing, M.A., C.K. Midobatu & P.H. Nixon (1992)- Structural setting, petrology and emplacement of serpentinites in the Koki Fault Zone, Port Moresby, Papua New Guinea. J. Southeast Asian Earth Sciences 7, 2-3, p. 147-158.
(Serpentinites from Koki Fault Zone chemically comparable with cumulate members of ultramafic ophiolite sequence. Mapping showed presence of three structural domains: imbricate thrust stack, the KFZ and possible passive roof duplex structure, suggesting deformation occurred close to front of foreland thrust belt)

Xu, M., D. Hou, X. Lin, J. Liu, W. Ding & R. Xie (2022)- Organic geochemical signatures of source rocks and oil-source correlation in the Papuan Basin, Papua New Guinea. J. Petroleum Science Engineering 210, 109972, p. 1-13.
(Papuan Basin, PNG, three oil families and three source rock groups, Jurassic, Cretaceous and Neogene. Family A oils mainly in Neogene limestone of Papuan Bay and neighboring South Fly Platform, likely from autochthonic Paleogene-Neogene mature marine shales. Family B mainly in Jurassic-Cretaceous Imburu and Toro Fm reservoirs in Papuan Fold Belt, derived from autochthonous Jurassic source. Family C mainly in Mendi-Puri Limestone reservoirs in EPFB; underlying Lower Cretaceous source most likely sources of Type C1 oils. Etc.)

Yang Lei & Kang An (2011)- Geological characteristics and reef-forming pattern of Antelope Reef gas field in Papua Basin. Xinjiang Petroleum Geol. 2011, 2, p.
(Papua Mesozoic- Cenozoic basin on margin of Australian continental plate with large Antelope gas field. Antelope field is Miocene pinnacle reef, developed on carbonate platform, with great thickness of reef)

Yates, K.R. & R.Z. de Ferranti (1967)- Geology and mineral deposits Port Moresby/ Kemp Welch area, Papua. Bureau Mineral Resources Geology Geophysics, Report 105, p. 1-117.
(online at: www.ga.gov.au/products-services/legacy-publications/reports.html)

(Mainly geological-geochemical investigation of Astrolabe copper-gold field, SE PNG. Oldest rocks in area U Cretaceous pink sheared limestone, unconformably overlain by unsheared Eocene (or Paleocene?; with Distichoplax; JTvG) glauconitic limestone, indicating ~Paleocene deformation event. Sadowa Oligocene gabbro, overlain by Dokuna Tuff and 50-100' thick Bootless Inlet Limestone with Te larger foraminifera (called E Miocene, but more likely Late Oligocene with Eulepidina and Heterostegina borneensis; JTvG), including reworked Eocene Nummulites-Pellatispira. E-M Miocene Globada Lst with Miogypsina unconformably over Eocene-Oligocene. Astrolabe agglomerate Pliocene pyroclastics (more likely Late Miocene age; Pain 1983))

Yokoyama, Y., T.M. Esat & K. Lambeck (2001)- Coupled climate and sea-level changes deduced from Huon Peninsula coral terraces of the last ice age. Earth Planetary Science Letters 193, p. 579-587.
(Huon Peninsula of NE PNG, is uplifting shoreline ringed by emergent coral terraces, formed during episodes of rapid sea-level rise, and constructing coral platforms that were subsequently uplifted. Last glacial (OIS 3) coral terraces coincide with timing of major N Atlantic climate reversals between 30- 60 ka.Growth of terraces tied to sea-level rises arising from ice-calving episodes from major N Atlantic and Antarctic ice-sheets that precipitated extremes of cold climate called Heinrich events. Sea-levels at this time 60-90m lower than present)

Young, G.A. (1963)- Northern New Guinea Basin reconnaissance aeromagnetic survey 1961. Bureau Mineral Resources Geology Geophysics (BMR), Record 1963/117, p. 1-7.
(online at: https://www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=11200)
(Three reconnaissance profiles across N New Guinea Basin indicate pronounced regional geological structures parallel to known structural trends)

Zahirovic, S. & D. Garrad (2020)- Tectonics and geodynamics of the New Guinea Region since the Triassic. Proc. 1st AAPG/EAGE Papua New Guinea Geoscience Conference Exhib., Port Moresby 2020, AAPG Search and Discovery Article 30670, p. 1-5. *(Extended Abstract)*
(online at: www.searchanddiscovery.com/pdfz/documents/2020/30670zahirovic/ndx_zahirovic.pdf.html)
(New global plate tectonic reconstruction since Triassic, incorporating long-lived Andean-type subduction along New Guinea margin during (Permian?-) Triassic, transitioning to back-arc opening from slab roll-back in M Jurassic. This event detached Sepik terrane, with seafloor spreading initiated by ~170-160 Ma in Sepik back-arc basin. Spatial origin of Sepik terrane along margin remains unknown. Roll-back and arc evolution likely represent origin of Philippine Arc. N-dipping subduction along Sepik terrane initiated in M-L Cretaceous. Sepik terrane accretion likely collision in E Eocene, but was likely diachronous along margin)

Zeng, Y. & B.A. McConachie (2000)- Application of integrated magnetic and seismic interpretation to identify petroleum prospects in Papua New Guinea. In: P.G. Buchanan et al. (eds.) Papua New Guinea's petroleum industry in the 21st century, Proc. 4th PNG Petroleum Convention, Port Moresby, p. 239-250.

Zhang, J., J.P. Davidson, M.C.S. Humphreys, C.G. Macpherson & I. Neill (2015)- Magmatic enclaves and andesitic lavas from Mt. Lamington, Papua New Guinea: implications for recycling of earlier-fractionated minerals through magma recharge. Journal of Petrology 56, 11, p. 2223-2256.
(online at: http://petrology.oxfordjournals.org/content/56/11/2223.full.pdf+html)
(Mt. Lamington composite volcano in PNG, on Papuan Ultramafic Belt (PUB) ophiolite. 1951 eruption produced andesitic dome lavas with basaltic-andesitic enclaves and few PUB ultramafic xenoliths. Presence of olivines in enclaves represents recycling of earlier-fractionated components through magma recharge)

Zhou, X. P. Peng, J. Zhang & C. Wang (2021)- In-situ chemistry of plagioclase and amphibole phenocrysts of Mt. Lamington volcano in Papua New Guinea: evidence for influence of Woodlark spreading ridge to Papuan arc. Lithos 396-397, 106242, p. 1-18.
(Isotope geochemistry of Quaternary Mt. Lamington, Papuan Peninsula, 1951 and older volcanics mix of three melt sources, and suggesting Lamington volcano represents western extension of Woodlark spreading ridge onto Papuan arc, which in turn was result of subduction to N)

Zhu, Z. & Z. Yang (2008)- Cenozoic adakites in Papua New Guinea and metallogetic significance. Jilin Daxue Xuebao (J. Jilin University), Earth Science Edition, 38, 4, p. 618-623.

(Adakites of PNG characterized by high Sr content, positive Sr anomaly peaks (average Sr/Y ratio >41.7) and negative Nb and Th anomalies. Y and Yb contents very low. 87Sr/86Sr values generally <0.704 5. Adakites of PNG located in both oceanic island arc and continental margin orogens in arc-continent collision setting. Some contain both world-class porphyry copper-gold deposits)

Zwingmann, H., T. Allan, K. Liu, D. Holland & D. Leech (2008)- Glauconite ages from Late Cretaceous reservoir sandstones of the Papuan Basin. In: J.E. Blevin et al. (eds.) Eastern Australasian Basins Symposium III, Sydney, Petroleum Exploration Society Australia (PESA) Special Publ., p. 259-262.
(Coniacian- Campanian glauconite ages of sandstones)

IX. QUATERNARY VOLCANISM- INDONESIA

IX.1. Quaternary Volcanism: General and Outside Java

(This listing is a selection of the extensive body of literature on Indonesia volcanic activity and its products. Many additional titles on volcanism specific to one region are included under these regions. Also, papers on Java volcanoes and volcanics are in a separate chapter, III.3)

Abrams, L.J. & H. Sigurdsson (2007)- Characterization of pyroclastic fall and flow deposits from the 1815 eruption of Tambora volcano, Indonesia using ground-penetrating radar. J. Volcanology Geothermal Research 161, p. 352-361.
(online at: https://people.uncw.edu/abramsl/abrams-sigurdsson-volgeo-07.pdf)
(Ground-penetrating radar helps image and characterize fall and pyroclastic flow deposits from Tambora 1815 eruption. Reflection of interface between pre-eruption clay-rich soil and pyroclastics reaches maximum thickness of 4m. Soil surface terraced and used for agriculture and buildings)

Abdul-Jabbar, G., H. Rachmat & M. Nakagawa (2019)- Temporal change of Barujari Volcano magmatic process: inferred from petrological study of erupted products since AD 1944. Proc. 1st Workshop on Environmental Science, Society, and Technology, Medan 2018, Journal of Physics: Conference Series 1363, 012030, p. 1-6.
(online at: https://iopscience.iop.org/article/10.1088/1742-6596/1363/1/012030/pdf)
(Active Barujari volcano in Lombok Island is part of post caldera stage of Rinjani volcano. Strombolian to vulcanian type eruptions with mainly basaltic-andesitic lavas(54-56 wt% SiO_2). Minor petrological changes in erupted material through time from 1944 to 2015)

Ahmady. F.N. &, D. Santoso (2024)- The interpretation of subsurface structure beneath Banda Api Volcano inferred from gravity data. Proc. 5th Int. Conference Geoscience and Earth Resources Engineering, Bandung 2023, IOP Conference Series: Earth and Environmental Science 1437, 012017, p. 1-4.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1437/1/012017/pdf)
(Bouguer anomaly range over Mount Banda Api- Neira complex is 130-200 mgal. Low gravity anomaly at center of Banda Api Volcano, likely response to presence of magma. Low gravity pocket also near hot spring area and ancient caldera of Neira, also indicating location of Neira magma chamber that has not cooled off)

Andreastuti, S., A. Budianto & E.T. Paripurno (2018)- Integrating social and physical perspectives of mitigation policy and practice in Indonesia. In: C.J. Fearnley et al. (eds.) Observing the volcano world- Volcano crisis communication, Advances in Volcanology, Springer Open, p. 307-320.
(online at: https://link.springer.com/content/pdf/10.1007/978-3-319-44097-2.pdf)

Andreastuti, S. D., N. Haerani, K. Kristianto, A.S. Prayoga, R. Putra, H.Y. Mboro et al.(2025)- Insight into the 2024-2025 eruption of Lewotobi Laki-Laki Volcano in Flores Island, Indonesia: an overview Indonesian J. on Geoscience (IJOG) 12, 3, p. 1-9.
(online at: https://ijog.geologi.esdm.go.id/index.php/IJOG/article/view/1318/516)

Ardianto, A.D. Nugraha, H. Afif, D.K. Syahbana, D.P. Sahara, Zulfakriza, S. Widiyantoro et al. (2021)- Imaging the subsurface structure of Mount Agung in Bali (Indonesia) using volcano-tectonic (VT) earthquake tomography. Frontiers in Earth Science 9, 619587, p. 1-13.
(online at: https://www.frontiersin.org/articles/10.3389/feart.2021.619587/full)
(Tomography from volcano-tectonic events in late 2017. Low seismicity zone at 2-5 km below Mt. Agung summit may be related to shallow magma reservoir.Anomalous region between Mt. Agung and Batur where most earthquakes before 2017 eruption originated, may be related to dyke complex between 8-14 km)

Arif, A.K.D., I.B.O. Agastya, R. Permadi, R. Marsaoly & I.K. Waliyanti (2024)- Utilization of geodiversity of Mount Gamalama eruption products as geotourism activities on the Batu Angus Geotrail, aspiring Ternate Geopark. Proc. The 5th Geotourism Festival & International Conference, 2024, 16p. *(online at: www.academia.edu/122039752/UTILIZATION_OF_GEODIVERSITY_OF_MOUNT_GAMALAMA etc.)*

(Mt Gamalama active stratovolcano on Ternate island in W Halmahera island arc, with geotourism potential. 1715m high, with lava, pyroclastics and lahars. First known eruption in historical times in 1538, then in 1687, 1772, 1775, 1839, 1843, 1864 and 1907)

Asrafil, A. Mukaddas, T. Hilmansyah, M.U. Botjing & E. Yuliastri (2020)- Mineralization study of volcanic rocks in Colo Volcano Tojo Una-Una Central Celebes. Jurnal Geomine, 8, 3, p. 171-180.
(online at: https://jurnal.teknologiindustriumi.ac.id/index.php/JG/article/download/705/pdf)
(Colo volcano on Una Una island, Gulf of Tomini, C Sulawesi, dominated by pyroclastic deposits, also some andesites. Hydrothermal alteration minerals present)

Bahar, I. & M. Girod (1983)- Controle structural du volcanisme indonesien (Sumatra, Java-Bali); application et critique de la method de Nakamura. Bull. Societe Geologique France (7), 25, 4, p. 609-614.
('Structural control on Indonesian volcanism (Sumatra, Java-Bali); application and critique of the Nakamura method')

Bani, P., Kristianto, S. Kunrat & D.K. Syahbana (2020)- Insights into the recurrent energetic eruptions that drive Awu, among the deadliest volcanoes on Earth. Natural Hazards Earth System Sciences 20, 8, p. 2119-2132.
(online at: https://nhess.copernicus.org/articles/20/2119/2020/nhess-20-2119-2020.pdf)
(Little known Awu volcano largest and northermost active volcano of Sangihe arc and among most deadliest. Regional geodynamic setting controlled by divergent-double-subduction collision and arc-arc collision, causing stalling of slab in mantle, increasing temperature, and becoming prone to melting. Awu also hosted lava dome and crater lake throughout its activity, creating hazardous situation (no mention of work by Kemmerling (1923))

Bani, P., F. Nauret, C. Oppenheimer, A. Aiuppa, B.U. Saing, N. Haerani, H. Alfianti, M.Marlia & V.Tsanev (2021)- Heterogeneity of volatile sources along the Halmahera arc, Indonesia. J. Volcanology Geothermal Research 418, 2, 107342, p. 1-12.
(Gas measurements and geochemical analyses of lavas for Dukono, Ibu, Gamkonora, Gamalama and Makian volcanoes of W Halmahera arc. Dukono greatest source of SO_2 and H_2; Ibu emits most H_2O and H_2S. Gamalama and Ibu significant CO_2 sources; Dukono (farthest from trench) CO_2-poor gas. Volcanic rocks composition variability along Halmahera arc indicates decreasing subducted sediment contribution from S (Makian, Gamalama) to N (Gamkonora, Ibu, Dukono))

Bani, P., C. Oppenheimer, V. Tsanev, B. Scaillet, S. Primulyana, U.B. Saing, H. Alfianti & M. Marlia (2022)- Modest volcanic SO_2 emissions from the Indonesian archipelago. Nature Communications 13, 3366, p. 1-15.
(online at: https://www.nature.com/articles/s41467-022-31043-7)
(New gas measurements from Indonesian volcanoes suggest rel. modest volcanic SO_2 emissions. Sulfur-rich eruptions reflect long-term accumulation of volatiles in reservoirs. Wit useful map of 126 active volcanoes)

Bani, P., G. Tamburello, E.F. Rose-Koga, M. Liuzzo, A. Aiuppa, N. Cluzel, I. Amat, D.K. Syahbana, H. Gunawan & M. Bitetto (2018)- Dukono, the predominant source of volcanic degassing in Indonesia, sustained by a depleted Indian-MORB. Bulletin of Volcanology 80, 5, p. 1-14. *(online at: www.researchgate.net/profile/Philipson-Bani/publication/321627294_Dukono_the_predominant_so Etc.)*
(Little known Dukono volcano on N Halmahera island regularly erupting since 1933. Gas emissions show huge magmatic volatile contribution into atmosphere, with annual output of ~290 kt SO_2, 5000 kt H2O, 88 kt CO_2, 5 kt H_2S and 7 kt H2 (in top 10 volcanic SO_2 sources on Earth). Degassing sustained by depleted Indian-MORB mantle source, currently undergoing lateral pressure from steepening of subducted slab, downward force from Philippine Sea plate and W-ward motion of continental fragment along Sorong fault)

Behringer, W. (2015)- Tambora und das Jahr ohne Sommer: Wie ein Vulkan die Welt in die Krise sturzte. Verlag C.H. Beck, Munich, p. 1-398.
('Tambora and the year without summer. How one volcano dragged the world into crisis')

Bennett, D., T. Ubide, J.F Ward, A. MacDonald, G. Rosenbaum, F.M.H. Sihombing, R.P. Nugroho, G.A. Jabbar & A.T. Tapu (2025)- Magmatic architecture of a potassic arc volcano: Batu Tara, Eastern Sunda Arc, Indonesia. Journal of Petrology 66, 9, egaf071, p. 1-24.
(online at: https://academic.oup.com/petrology/article/66/9/egaf071/8234243)
(Batu Tara volcano, 50 km N of Flores, is located off-axis to main E Sunda arc, where the slab reaches depths of ~230 km. Base of volcano ~3000m below sea level, with additional 630m above sea level. Ultrapotassic mafic plagioclase-free magmas with abundant clinopyroxene, leucite and olivine. Batu Tara, and possibly other anomalous arc volcanoes with mafic compositions, fed by relatively direct transfer of mafic melts from depth)

Blumenthal, M. (1921)- Bergwanderungen und Bergstudien auf der Insel Lombok. Jahrbuch der Schweizer Alpenclub 55 (1920), p. 55-
('Mountain hikes and mountain studies on Lombok Island'. Well illustrated account of a 1918 ascent of the Rinjani volcano complex, during a private trip by Swiss BPM geologist). The current active Rinjani volcano is located within large a caldera lake named Segara Anak (formed during explosive eruption of Mount Samalas volcano in 1257; HvG). Highest part of Rinjani calder rim is at 3795m above sea level)

(Rindjani large, active compound strato-volcano on Lombok, in W part of E Sunda Arc. Pleistocene-Recent calcalkaline suite composed of diverse lavas, including ankaramite, high-Al basalt, andesite, high-K andesite and dacite. Sr-isotopic and geochemical constraints suggest derivation from sub-arc mantle)

Foden, J.D. (1986)- The petrology of Tambora volcano, Indonesia: a model for the 1815 eruption. J. Volcanology Geothermal Research 27, p. 1-41.
(online at: www.researchgate.net/publication/223441162_The_petrology_of_Tambora_volcano_Indonesia_A_model_for_the_1815_eruption)
(Lavas of Tambora volcano on Sumbawa of unusual, moderately undersaturated, K_2O-rich types, ranging from ne-trachybasalt to ne-trachyandesite. Products of 1815 eruption black, glassy, biotite-bearing, ne-trachyandesites with scoria, pumice and tuff of same composition. 1815 eruption followed long period of inactivity)

Foden, J.D. & R. Varne (1980)- The petrology and tectonic setting of the Quaternary- Recent volcanic centers of Lombok and Sumbawa. Chemical Geology 30, p. 201-226.
(online at: https://www.academia.edu/58486973/The_petrology_and_tectonic_setting_of_Quaternary_Recent_volcanic_centres_of_Lombok_and_Sumbawa_Sunda_arc)
(Bali-Lombok-Sumbawa sector of Sunda arc flanked in N and S by oceanic crust. Oldest rocks from Lombok and Sumbawa islands Lower Miocene- Pliocene sediments and volcanics beneath Quaternary volcanic centers. Three large active volcanoesin N parts of Lombok (Rindjani; basalt-andesite-dacite) and Sumbawa (Tambora and Sangeang Api; trachybasalt-trachyandesite), all ~150-190 km above N-dipping Benioff zone. Extinct Quaternary centers S of active volcanoes on Sumbawa (Soromundi, Sangenges). Volcanic composition-space-time relations in Lombok-Sumbawa sector not in accordance with general island-arc schemes)

Foden, J.D. & R. Varne (1981)- The geochemistry and petrology of the basalt-andesite-dacite suite from Rinjani volcano, Lombok: implications for the petrogenesis of island arc, calcalkaline magmas. In: A.J. Barber & S. Wiryosujono (eds.) The geology and tectonics of Eastern Indonesia, Proc. CCOP-IOC SEATAR Working Group Meeting, Bandung 1979, Geological Research Development Centre (GRDC), Bandung, Special Publ. 2, Bandung, p. 115-134.
(Rinjani lavas compositionall diverse, from ankaramites and high-Al basalts to andesites and dacites, representing typical calkalkaline association erupted by many Circum-Pacific volcanoes)

Foden, J.D. & R. Varne (1981)- Petrogenetic and tectonic implications of near coeval calk-alkaline volcanism on Lombok and Sumbawa islands in the eastern Sunda Arc. In: A.J. Barber & S. Wiryosujono (eds.) The geology and tectonics of Eastern Indonesia, Proc. CCOP-IOC SEATAR Working Group Meeting, Bandung 1979, Geological Research Development Centre (GRDC), Bandung, Special Publ. 2, Bandung, p. 135-152.
(Quaternary volcanoes of Lombok- Sumbawa sector of E Sunda Arc occur 165-190km above N-dipping Benioff zone. Diverse range of lavas. No correlation between K2) content and depth to Benioff zone. Between-volcano variations reflect mantle source heterogeneity)

Fontijn, K., F. Costa, I. Sutawidjaja, C.G. Newhall & J.S. Herrin (2015)- A 5000-year record of multiple highly explosive mafic eruptions from Gunung Agung (Bali, Indonesia); implications for eruption frequency and volcanic hazards. Bulletin of Volcanology 77, 59, p. 1-15.
(Mt. Agung has an average eruptive frequency of one VEI ≥2–3 eruptions per century)

Gao, M.H. & P.P. Liu (2023)- Mixing and eruption of mafic magmas of the Sipisupisu volcano, the Toba volcanic system, Indonesia. Contributions to Mineralogy and Petrology 178, 65, p.
(Sipisupisu volcano stratocone on NW tip of Toba Caldera produced two super-eruptions in Quaternary. Mineralogy of basalts and basaltic andesites indicates open-system processes with multiple episodes of magma

recharge and mixing. Melts ascended from large basaltic magma reservoir at Moho and resided in at least three staging magma reservoirs within crust. Etc.)

Gardner, J.E., P.W. Layer & M.J. Rutherford (2001)- Phenocrysts versus xenocrysts in the youngest Toba Tuff: implications for the petrogenesis of 2800 km^3 of magma. Geology (GSA) 30, 4, p. 347-350.
(40Ar/39Ar dating of biotite, sanidine, hornblende, and plagioclase from youngest Toba Tuff of 75 ka suggests hornblende and some plagioclase are xenocrysts and came from at least 1.5 Ma old source)

Gasparon, M., D.R. Hilton & R. Varne (1994)- Crustal contamination processes traced by helium isotopes: examples from the Sunda arc, Indonesia. Earth Planetary Science Letters 126, p. 15-22.
(Helium He-3/He-4 isotope data from olivine and clinopyroxene from 13 volcanic centers between C Sumatra and Sumbawa in Sunda arc indicate crustal contamination unrelated to subduction in Sunda arc)

Gasparon, M. & R. Varne (1998)- Crustal assimilation versus subducted sediment input in west Sunda arc volcanics: an evaluation. Mineralogy and Petrology 64, p. 89-117.
(Geochemical analyses of Quaternary-Cretaceous sediments from NE Indian Ocean used to estimate composition of sedimentary material subducted along Sunda Trench. Post-Miocene siliceous clastic sediments near Sunda arc largely derived from arc itself, largely accreted and not subducted. The least contaminated arc volcanics in W section of W Sunda arc, where sediment flux highest. Assimilation of crustal material by uprising melts from Indian Ocean-type mantle wedge better accounts for isotope changes of arc volcanics, and ties to variations in crustal thickness and composition along arc)

Gatti, E. (2012)- Geochemical and sedimentological investigations of Youngest Toba Tuff ashfall deposits. Ph.D. Thesis University of Cambridge, p. 1-181. *(Unpublished)*
(online at: https://www.repository.cam.ac.uk/handle/1810/244398)
(Study of Youngest Toba Tuff (YTT), a rhyolitic co-ignimbrite ashfall from ~73 ka 'super-eruption' of Toba caldera in Sumatra, the largest known eruption of Quaternary time. In proximal (Lake Toba) and more distal (Malaysia, India) settings)

Gatti, E & C.Oppenheimer (2012)- The utilization of distal tephra records for understanding climatic and environmental consequences of extreme eruptions: a case study from the Youngest Toba Tuff. Liu, P.P., L. Caricchi, S.L. Chung, X.H. Li, Q.L. Li, M.F. Zhou, Y.M. Lai, A.A. Ghani, T. Sihotang et al. (2021)- Growth and thermal maturation of the Toba magma reservoir. Proc. National Academy of Sciences USA (PNAS) 118, 45, e2101695118, p. 1-9.
(online at: https://www.pnas.org/doi/full/10.1073/pnas.2101695118)
(Caldera-forming eruptions at Toba are result of progressive thermal maturation of upper crustal magma reservoir, which grows and chemically homogenizes, by sustained magma influx over past 2.2 My. If rate of magma input was maintained since last supereruption at 75 ka, volume of potentially eruptible magma available today is minimum of ~315 km^3)

Liu, P.P., S.L. Chung, C.A. Chesner, M.H. Gao, Y.M. Lai, H.Y. Lee & Y.H. Yang (2022)- New insights into the petrogenesis of voluminous crustal-signature silicic volcanic rocks of the Toba eruptions (Indonesia). J. of Geophysical Research: Solid Earth 127, 12, e2022JB024559, p. 1-18.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2022JB024559)
(Toba example of large-volume silicic magmas in arc setting. Quaternary Toba eruptions and nearby pre-caldera Haranggaol Andesite on Sumatra significantly enriched Sr-Nd isotopes, similar to post-caldera (<74 ka) Sipisupisu basalts near Toba Caldera. Thermodynamic modeling shows Toba silicic rocks can be produced from mantle-derived basaltic melts. Binary modeling of Sr-Nd isotopes suggests Toba rocks can be produced by mixing of 5-10% of subducting Nicobar Fan sediments with depleted MORB mantle)

Liu, P.P., S.L. Chung, B. Ma, X.H. Li, Q.L. Li, H.Y. Lee & X.R. Zhang (2022)- Zircon Hf-O isotopic constraints on the origin and temporal evolution of the Toba volcanic system, Indonesia. Lithos 434-435, 106925, p. 1-7.
(Temporal evolution of Toba volcanic system from ~1.5 Ma up to now, including two super-eruptions, Young Toba (YTT) at ~74 ka and Pld Toba (OTT) at 790 ka. MTT erupted at ~501 ka. Zircon Hf-O isotopes of latest five Toba eruptions suggest enriched, heterogenous mantle source with significant crustal contamination (incl. subducted Nicobar Fan terrigenous sediments?, followed by crustal contamination during ascent or storage in shallow magma reservoirs. Two inherited zircon cores with U-Pb ages of ~154 and 197 Ma)

Liu, P.P., D.B. Wang, M.F. Zhou, X.H. Li, Q.L. Li, G.A. Gaetani, B. Monteleone & V. Kamenetsky (2023)- Constraints of boron and oxygen stable isotopes on dehydration fluids, sediment-derived melts, and crustal assimilation of the Toba volcanic system (Indonesia). Geology (GSA) 52, 3, p. 161-165.
(Arc magmas produced from mantle wedge, with possible addition of fluids and melts from serpentinites and sediments in subducting slab. Oxygen isotopic compositions of zoned olivines from post-caldera basalts and Boron contents and isotopes of basalts and glassy melt inclusions in silicic tuffs in Toba volcanic system, N Sumatra, reflect assimilation of high δ18O crustal materials during fractional crystallization, with >40% of fluids derived from serpentinites and others from altered oceanic crust and sediments)

Liu, Z., C. Colin & A. Trentesaux (2006)- Major element geochemistry of glass shards and minerals of the Youngest Toba Tephra in the southwestern South China Sea. J. Asian Earth Sciences 27, p. 99-107.
(4cm thick ash layer in Core MD01-2393 from SW S China Sea at Marine Isotope Stage 4-5 transition at ~74 ka. Morphology and geochemistry of glass shards confirm origin from Youngest Toba eruption, N Sumatra)

Luais, B. (1987)- Petrologie et geochimie (elements trace et rapports isotopiques du Sr) du magmatisme associe aux zones de subduction. Examples du Bassin Mediterraneen et des Isles de la Sonde (Merapi, Java). Thesis, Universite de Montpellier, Documents Travaux Centre Geologique Geophysique Montpellier, 9, p. 1-237.

(Marapi volcano in Sumatra characterized by frequent short-lived, small eruptions (VEI 1-2. In past 250 years, volcano erupted >60 times. Petrologic study of summit bombs uses pyroxene, plagioclase and glass compositions for P and T of magma storage estimates of 4-7 kbar (~15-26 km). Inversion reveals low velocity zone at 15-21 km depth and is likely magma storage)

Oppenheimer, C. (2002)- Limited global change due to the largest known Quaternary eruption, Toba ~74kyr BP?. Quaternary Science Reviews 81, p. 1593-1609.
(≈74 kyr BP 'super-eruption' of Toba volcano in Sumatra is largest known Quaternary eruption. A possible 6 year long 'volcanic winter' following eruption has been proposed, but previous estimates of globally averaged surface cooling of 3-5°C after eruption probably too high; closer to 1°C)

Oppenheimer, C. (2003)- Climatic, environmental and human consequences of the largest known historic eruption; Tambora Volcano (Indonesia) 1815. Progress in Physical Geography 27, 2, p. 230-259. *(online at: www.researchgate.net/publication/233720521_Climatic_environmental_and_human_consequences_of_the_largest_known_historic_eruption_Tambora_volcano_Indonesia_1815)*
(1815 eruption of Tambora volcano (Sumbawa) expelled around 140 gt of magma (equivalent to ≈50 km^3 of dense rock), making it largest known historic eruption. More than 95% erupted as pyroclastic flows, but 40% of material ended up as ash fallout from 'phoenix' clouds that lofted above flows during emplacement. Short-lived plinian explosions preceded main eruption and caldera collapse, propelling plumes up to 43 km altitude. Over

71,000 people died on Sumbawa and Lombok. Eruption injected ≈60 mt of sulfur into stratosphere, forming global sulfate aerosol veil in stratosphere, resulting in anomalously cold weather in N Hemisphere)

Pacey, A., C.G. Macpherson & K.J.W. McCaffrey (2013)- Linear volcanic segments in the central Sunda Arc, Indonesia, identified using Hough Transform analysis: implications for arc lithosphere control upon volcano distribution. Earth Planetary Science Letters 369-370, p. 24-33.
(manuscript online at: https://dro.dur.ac.uk/11833/1/11833.pdf)
(In Sunda Arc most volcanoes define four en echelon, linear segments, each of 500-700 km length. Volcanoes of Java that do not lie on these segments either formed at early stage in history of arc and erupted anomalous magma, or lie along other mapped structures)

(Western Sunda volcanic arc stretches across Sumatra and Java, and hosts 83 active volcanoes, including Mts. Sinabung, Krakatau, Tangkuban Parahu, Merapi, Semeru, etc.). Study of surface lineaments and temperature allows subdivision of W Sunda Arc into nine zones, 5 in Sumatra, 4 in Java)

Raible, C.C., S. Bronnimann, R. Auchmann, P. Brohan, T.L. Frolicher, H.F. Graf, P. Jones et al. (2016)- Tambora 1815 as a test case for high impact volcanic eruptions: Earth system effects. WIREs Climate Change 7, 4, p. 569-589.
(online at: www.ncbi.nlm.nih.gov/pmc/articles/PMC6686350/pdf/WCC-7-569.pdf)
(Good review of climate impacts from the 1815 Tambora eruption on Sumbawa, incl. likely strengthening of wintertime stratospheric polar vortex, global cooling, slowdown of water cycle, weakening of summer monsoon circulations,strengthening of Atlantic Meridional Overturning Circulation, and decrease of atmospheric CO_2)

Rampino, M.R. & S.H. Ambrose (2000)- Volcanic winter in the Garden of Eden: the Toba supereruption and the late Pleistocene human population crash. In: F.W. McCoy & G. Heiken (eds.) Volcanic hazards and disasters in human antiquity, Geological Society of America (GSA), Special Paper 345, p. 71-82.
(online at: www.researchgate.net/publication/279723381_Volcanic_winter_in_the_Garden_of_Eden_ Etc.)
(Toba eruption in N Sumatra at ~73,500 B.P. largest explosive eruption of last few 100k years.Produced abundant dust and H2SO4 aerosols, and ice-core data indicate ~6-yr residence time for global aerosol cloud. Aerosol loading probably caused 'volcanic winter' with possible regional coolings of 15° C and global cooling of 3-5° C for several years.Tropical vegetation probably destroyed.Genetic studies indicate humans suffered severe population bottleneck sometime before ~60,000 yrs ago, followed by rapid population increase and migrations. Possible connection between Toba event and human population bottleneck)

Rampino, M.R. & S. Self (1982)- Historic eruptions of Tambora (1815), Krakatau (1883) and Agung (1963), their stratospheric aerosols, and climatic impact. Quaternary Research 18, 2, p. 127-143.
(Decreases in surface temperatures after eruptions of Tambora, Krakatau and Agung were of similar magnitude, although amounts of dust and volatiles injected into stratosphere differed greatly. Large amounts of fine ash and volatiles dispersed into upper atmosphere by Krakatau and Tambora; Agung eruption in 1963 was smaller, but injected dust and volatiles into stratospheric aerosol layer more directly. Agung eruption relatively rich in SO_2 and Cl. Relative amounts of fine ash produced by Tambora, Krakatau and Agung eruptions estimated at 150: 20: 1, atmospheric sulfate aerosols ~7.5: 3: 1. Decreases in surface T after volcanic eruptions mainly result of sulfate aerosols, rather than silicate dust)

Rampino, M.R. & S. Self (1992)- Volcanic winter and accelerated glaciation following the Toba super- eruption. Nature 359, 6390, p. 50-52.
(Eruption of Toba in Sumatra 73,500 years ago largest known explosive volcanic event in Late Quaternary. Model calculations of climatic effects of volcanic cloud suggest it may have produced 'volcanic winter', followed by few years surface-temperature decreases of 3-5 °C. Eruption during Stage 5a-4 transition of oxygen isotope record may have accelerated shift to glacial conditions that was already underway)

Rampino, M.R. & S. Self (1993)- Climate- volcanism feedback and the Toba eruption of ~74000 years ago. Quaternary Research 40, p. 269-280.
(online at: https://zenodo.org/record/1229950/files/article.pdf)
(Toba eruption (~74,000 yrs ago) during δ18O Stage 5a-4 transition period of rapid ice growth and falling global sea level, which may have been a factor in creating stresses that triggered volcanic event. Stratospheric dust and sulfuric acid aerosol clouds may have created brief cooling ('volcanic winter'), with N Hemisphere surface T

decreases of ~3°-5°C. Summer T decreases of >10°C at high N latitudes adjacent to regions already covered by snow may have increased snow/ sea-ice extent, accelerating cooling already in progress)

Ranneft, T.S.M. (1979)- Segmentation of island arcs and application to petroleum geology. J. Petroleum Geology 1, 3, p. 35-53.
(Island arcs commonly depicted as curved or sinuous, but most are composed of straight segments whose trend changes suddenly at hinge or boundary zones (multiple transverse faults). Fracture system may be related to structural, morphological, or movement of underthrusting slab, or movement in backdeep or overthrusting sheet. Transverse structural systems had effect on petroleum accumulations of island arc regions, both from stratigraphic and structural viewpoint. Examples of modern Indonesian arc system)

Reid, M.R. & J.A. Vazquez (2017)- Fitful and protracted magma assembly leading to a giant eruption, Youngest Toba Tuff, Indonesia. Geochem. Geophysics Geosystems 18, 1, p. 156-177.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/2016GC006641/epdf)
(Eruption of 74 ka Youngest Toba Tuff of N Sumatra produced 2800 km^3 of ignimbrite and coignimbrite ashfall. Relatively many zircons nucleated before earlier eruption at 501 ka, but most zircons yielded interior dates 100-300 ka thereafter. Zircon growth likely episodic over protracted time intervals of >100- >500 ka. Repeated magma recharge may have contributed to development of compositional zoning in YTT, but perturbations to magma reservoir over >400 ka did not lead to eruption until 74 ka)

Reubi, O. & A. Nicholls (2004)- Variability in eruptive dynamics associated with caldera collapse: an example from two successive eruptions at Batur volcanic field, Bali, Indonesia. Bulletin of Volcanology 66, 2, p. 134-148.
(Batur volcanic field in Bali two caldera-forming eruptions, at 29,300 and 20,150 years BP., resulting in deposition of dacitic ignimbrites. Ubud Ignimbrite covers most of S Bali and consists dominantly of pyroclastic flow with minor pumice fall deposits. Gunungkawi Ignimbrite more limited extent, occurs only in central S Bali)

Reubi, O. & A. Nicholls (2004)- Magmatic evolution at Batur volcanic field, Bali, Indonesia: petrological evidence for polybaric fractional crystallization and implications for caldera-forming eruptions. J. Volcanology Geothermal Research 138, p. 345-369.
(Batur volcanic field in Bali underwent complex evolution that comprised three periods of building and two major caldera-forming eruptions)

Reubi, O. & A. Nicholls (2005)- Structure and dynamics of a silicic magmatic system associated with caldera-forming eruptions at Batur Volcanic Field, Bali, Indonesia. Journal of Petrology 46, 7, p. 1367-1391.
(online at: http://petrology.oxfordjournals.org/content/46/7/1367.full.pdf+html)
(Quaternary Batur volcanic field in Bali ~150 km above Benioff zone and adjacent to active Agung volcano and extinct or dormant Bratan caldera. Two caldera-forming eruptions and broad range of compositions from low-SiO2 andesite to high-SiO2 dacite. Earliest volcanism was building of Penulisan basaltic-dacitic stratovolcano starting at least at ~510 ka. Collapse of first caldera associated with eruption of dacitic Ubud ignimbrite at 29,300 yrs BP. After formation of Bunbulan lava-dome complex collapse of second caldera, with eruption of Gunungkawi Ignimbrite at 20,150 yrs BP. Followed by 1700 m high, basaltic andesite Batur stratovolcano)

Rittmann, A. (1953)- Magmatic character and tectonic position of the Indonesian volcanoes. Bulletin of Volcanology 14, p. 45-58.
(Review of chemical compositions of magmas of Indonesian active volcanoes. Volcanoes classified as (1) Calc-alkaline (= Pacific; 30/ 91%), (2) Alkaline (= Atlantic; 2; 6%) and Potassic (= Mediterranean; 1/ 3%). Calc-alkaline character of magmas of active volcanoes decreases regularly in direction from foredeep to hinterland, becoming alkaline in hinterland itself. Also, at single volcanoes calc-aIkaline character decreases with time, 'confirming migration of axis of orogen towards foredeep')

(online at: https://journal.ugm.ac.id/ijg/article/view/74692/pdf)
(Classification of morphologies of Indonesian stratovolcanoes. Four types identified: (1) small-little-dissected cones (typically ~2 km wide?, steep, dominated by basic-intermediate rocks with common mafic minerals, primarily lava flows and scoria); (2) broad-dissected cones (intermediate lava composition, poor in mafic minerals and rich in hydrous minerals, with abundant pumice and lava domes; (3) extremely broad-dissected cones with caldera (~18 km wide, gently-sloped, rich in felsic rocks and minerals, with thick ignimbrite deposits (e.g. Toba); (4) residual-highly dissected cones (moderate size (=8 km wide), gently-sloped, rich in ultrabasic rocks and mafic minerals with common exposure of intrusions (e.g. Ringgit-Beser))

(Same title as Van Bemmelen 1963. On Java- Sumatra three Cenozoic pulses of uplift with intrusions and extrusions of acid magmas. Cenozoic deposits start with deposition of Eocene quartz sandstones and marine sediments without tuffaceous components. This was followed by Oligocene- E Miocene 'Old-Andesite' volcanoes, which are largely submarine and represent first cycle of andesitic, calc-alkaline Pacific volcanism. M Miocene second pulse of uplift with formation of proto-Semangko rift with acid magma on Sumatra (between E Miocene Telisa and M Miocene Lower Palembang beds. In Mio-Pliocene time subsidence again prevailed in Sumatra-Java belt. Andesitic volcanism resumed, forming 2nd Andesite Fm (M Palembang Beds of Sumatra, Bentang Beds, etc of Java). At end Tertiary a third pulse of orogenic uplift, creating present Sumatra-Java geanticline, again accompanied by rifting and voluminous outbursts of acid pumiceous tuffs on Sumatra)

Van Bemmelen, R.W. (1963)- Volcanology and geology of ignimbrites in Indonesia, North Italy, and the U.S.A. Bulletin of Volcanology (Bulletin Volcanologique), ser. 2, 25, 1, p. 151-173.
(Same as Van Bemmelen 1961. Sumatra -Java arc of Indonesia three pulses of orogenic uplift after its Mesozoic geosynclinal subsidence. All three accompanied by rise and occasional ignimbritic eruptions of acid magma. 'Normal' igneous rocks of intermediate composition erupted during intervening periods)

Van Bemmelen, R.W. (1971)- Four volcanic outbursts that influenced human history. Toba, Sunda, Merapi and Thera. In: Acta First Int. Scientific Congress on the Volcano of Thera, Archaeological Service of Greece, Athens 1971, p. 5-50.

Van Bergen, M.J., R.D. Erfan, T. Sriwana, K. Suharyono, R.P.E. Poorter, J.C. Varekamp et al. (1989)- Spatial geochemical variations of arc volcanism around the Banda Sea. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 24, 2-3, p. 313-322.

(Active volcanoes of E Sunda Arc and Banda Arc 100-250 km above Benioff zone. Wide range of lavas, from are-tholeiitic (low-K) to leucite-bearing (alkaline) suites. Variations along and across arc. For volcanoes with similar distance to Benioff zone potassium and other incompatible elements progressively increase towards collision area near Timor, and close to Timor also increasing with increasing distance to Benioff zone)

Van Bergen, M.J., P.Z. Vroon & J.A. Hoogewerff (1993)- Geochemical and tectonic relationships in the east Indonesian arc-continent collision region: implications for the subduction of the Australian passive margin. Tectonophysics 223, 1-2, p. 97-116.
(Variations in isotope signatures along E Sunda Arc show maximum magma source contamination near extinct sector N of Timor. Increasing contribution of subducted continental material in direction of collision. Leading part of Australian continental margin reached magma generation zone in E Sunda- W Banda arc, implying subduction of continental margin deeper than 100 km)

Van Bergen, M.J., P.Z. Vroon, J.C. Varekamp & R.P.E. Poorter (1991)- Subduction of continental material in East Indonesia; a review of evidence from the geochemistry of volcanic rocks. In: E.P. Utomo et al. (eds.) Proc. The Silver Jubilee LIPI- Symposium on the Dynamics of subduction and its products, Yogyakarta-Karangsambung 1991, Research and Development Center for Geotechnology, Indonesian Institut of Sciences (LIPI), Bandung, p. 38-41.

Van Bergen, M.J., P.Z. Vroon, J.C. Varekamp & R.P.E. Poorter (1992)- The origin of the potassic rock suite from Batu Tara volcano (East Sunda arc, Indonesia). Lithos 28, p. 261-282. *(online at: www.academia.edu/20632659/The_origin_of_the_potassic_rock_suite_from_Batu_Tara_volcano Etc.)*
(Batu Tara is active potassic volcano in E Sunda arc. Leucite-bearing rock suite two groups, suggesting parental magmas with different mantle origins. Trace element and isotopic compositions consistent with involvement of subducted sedimentary/crustal component as well as MORB and OIB mantle)

(online at: https://www.stichtingblauwelijn.nl/assets/files/1941-09.pdf)
(Introduction to geochemistry of rocks from the Netherlands Indies/Indonesia)

Varekamp, J.C., M.J. Van Bergen, P.Z. Vroon, R.P.E. Poorter, A.D. Wirakusumah, R. Erfan, K. Suharyono & T. Sriwana (1989)- Volcanism and tectonics in the Eastern Sunda Arc, Indonesia. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 24, p. 303-312.

(Four segments distinguished by Sr isotopes in Java-Sunda-Banda volcanic arc. Adonara-Pantar segment between Flores and Alor studied here, transition between W Banda Arc volcanics (in E) with clear 'continental' signature and Sunda Arc volcanics (in W) with little evidence of subduction of continental material)

Varekamp, J.C. & R. Kreulen (2000)- The stable isotope geochemistry of volcanic lakes, with examples from Indonesia. J. Volcanology Geothermal Research 97, 1-4, p. 309-327.

Varne, R. (1985)- Ancient subcontinental mantle; a source for K-rich orogenic volcanics. Geology (GSA) 13, 6, p. 405-408.
(Mafic volcanics, ranging from calc-alkaline basalts through shoshonitic trachybasalts to leucitites, along E Sunda Arc arc from Bali (Agung) to Flores. With 3-fold enrichment in K, Rb, Sr, Ba, La and Nb, increasing toward collision zone, correlating with increasing 87Sr/86Sr and decreasing 143Nd/144Nd values. K-rich material derived from ancient subcontinental mantle. E Sunda K-rich mafic volcanism first appeared after collision began. Before collision, ancient NW Australian mantle erupted K-rich, diamond-bearing ultramafics with high Sr and low Nd ratios, part of ultrapotassic continental volcanic association)

Varne, R. & J.D. Foden (1986)- Geochemical and isotopic systematics of Eastern Sunda Arc volcanics: implications for mantle sources and mantle mixing processes. In: F.C. Wezel (ed.) The origin of arcs, Developments in Geotectonics 21, Elsevier, p. 159-189.
(E Sunda-Banda arc system erupting mafic volcanics that range from calc-alkaline basalts, through shoshonitic trachybasalts, to leucite tephrites and olivine leucitites. All typical arc-like geochemistry. K, Rb, Sr, Ba, La, and Nb contents increase threefold along arc towards collision zone. Systematic geochemical and Sr, Nd, Pb isotope changes reflect involvement of at least two sources poor in K-group elements, etc. No strong evidence that either is recently subducted upper crustal sialic material. Isotopic data suggest subcontinental mantle may be source of K-rich arc component; suboceanic mantle may be source of K-poor component)

Verstappen, H.T. (1963)- Geomorphological observations on Indonesian volcanoes. Tijdschrift Koninklijk Nederlands Aardrijkskundig Genootschap (2), 80, 3, p. 237-251.

(online at: https://dwc.knaw.nl/DL/publications/PU00010947.pdf)
(Four Mesozoic- Tertiary concentric belts of fold structures and plutonic rocks in Indonesia, connecting Burma with Philippines, each with own types of plutonic rocks and ore deposits: (1) Jurassic Malayan orogen of Malay Peninsula, Tin islands, possibly W, SW and C Kalimantan; (2) Late Cretaceous Sumatra orogen of Sumatra, C Java, Meratus; (3) M Miocene Soenda orogen (should be E Miocene; 'Old Andesites'; JTvG) of SW Sumatra, Java S Mountains, volcanic Lesser Sunda islands) and (4) the active Moluccan orogen. Late Quaternary volcanics two groups, 'Pacific' calc-alkaline and 'Mediteranean' potassic. Analyzed 157 samples for radioactivity and bulk chemical composition. Mesozoic granites from Tin islands very different petrochemistry from Kalimantan (Schwaner Mts, etc.) granites)

Westgate, J.A., P.A.R. Shane, N.J.G. Pearce, W.T. Perkins, R. Korisettar, C.A. Chesner, M.A.J. Williams & S.K. Acharyya (1998)- All Toba tephra occurrences across Peninsular India belong to the 75,000 yr B.P. eruption. Quaternary Research 50, 1, p. 107-112.
(online at: www.researchgate.net/publication/223750339_All_Toba_Tephra_Occurrences_across_P Etc.)
(All presently known Toba tephra occurrences in peninsular India belong to 75,000 yr B.P. Toba eruption. Tephra bed can be used as effective tool in correlation and dating of late Quaternary sediments across India)

Wetzel, A. (2009)- The preservation potential of ash layers in the deep-sea: the example of the 1991-Pinatubo ash in the South China Sea. Sedimentology 56, p. 1992-2009.

(After 1991eruption of Mount Pinatubo volcano, Philippines, volcanic ash transported W to S China Sea in atmospheric plume, formed up to 10cm thick graded layer over >400,000 km^2. Immediately after deposition surviving deep- burrowing animals re-opened connection to sea floor. Later, small meiofauna and macrofauna recolonized sea floor, mixing newly deposited organic material with underlying ash. Ash deposits <1mm thick not often observed as continuous layer when cored 6 years after eruption; ash ~2mm thick now patchily bioturbated. Areas affected by deposition of turbidites ash layer often preserved due to rapid burial)

Wheller, G.E. (1986)- Petrogenesis of Batur caldera, Bali, and the geochemistry of Sunda-Banda arc basalts. Ph.D. Thesis, University of Tasmania, Hobart, p. 1-156. *(Unpublished) (online at: https://figshare.com/articles/thesis/Petrogenesis_of_Batur_caldera_Bali_and_the_geochemistry_of_Sunda-Banda_arc_basalts/23241779?file=40959071)*
(Batur active volcano s produced a wide variety of basaltic (incl. leucititic magmas) to dacitic volcanic rock types during its evolution and now possesses a large double caldera. New basaltic stratovolcano forming within caldera. Etc (remarkably, no mention of the C.E. Stehn (1928) monograph on Batur/Batoer; JTvG))

Wheller, G.E. & R. Varne (1986)- Genesis of dacitic magmatism at Batur volcano, Bali, Indonesia: Implications for the origin of stratovolcano calderas. J. Volcanology Geothermal Research 28, p. 363-378.
(Batur active stratovolcano on Bali, Indonesia, with large caldera correlated with eruption at ~23,700 years ago that formed thick Bali ignimbrite sheet, covering 450 km^2. Formation of caldera due to change in lava composition from basaltic- andesitic to dacitic. Dacitic rocks characteristics consistent with origin by crystal-liquid fractionation from more mafic parent magmas in shallow chamber, possibly at 1.5 km depth and 1000-1070°C)

Wheller, G.E., R. Varne, J.D. Foden & M.J. Abbott (1987)- Geochemistry of Quaternary volcanism in the Sunda-Banda arc, Indonesia, and three-component genesis of island-arc basaltic magmas. J. Volcanology Geothermal Research 32, 1-3, p. 137-160.
(online at: https://www.academia.edu/110578826/Geochemistry_of_quaternary_volcanism_in_the_Sunda_Banda_ arc_Indonesia_and_three_component_genesis_of_island_arc_basaltic_magmas)
(Excluding Sumatra and Wetar (mainly dacitic and rhyolitic volcanics), four geochemical arc sectors in Sunda-Banda arc: W Java, Bali, Flores (each more K-rich eastwards, culminating in leucitite volcanoes Muriah, Soromundi, Sangenges and Batu Tara). Dominant source component common to all sectors probably peridotitic mantle. Second component, with high 87Sr/86Sr value, may be crustal material, most apparent in Banda sector, but also present to lesser extents in W Java and Flores sectors)

Whelley, P.L., C.G. Newhall & K.E. Bradley (2015)- The frequency of explosive volcanic eruptions in Southeast Asia. Bulletin of Volcanology 77, 1, p. 1-11.
(online at: http://link.springer.com/article/10.1007/s00445-014-0893-8?view=classic)
(~733 active and potentially active volcanoes in SE Asia region, of which 70 have erupted in last 100 years)

Whitford, D.J. (1975)- Strontium isotopic studies of the volcanic rocks of the Sunda arc, Indonesia, and their petrogenetic implications. Geochimica Cosmochimica Acta 39, p. 1287-1302.
(Pleistocene-Recent lavas from Sunda arc range from island arc tholeiitic series, through calc-alkaline to high-K alkaline rocks. Calc-alkaline suite decrease in 87Sr/86Sr from W Java to Bali with some evidence for increasing 87Sr/86Sr with increasing depth to Benioff zone. 87Sr enrichment due to isotopic equilibration of oceanic crust with sea water and disequilibrium melting in slab. Calc-alkaline lavas with high ratios best explained by sialic contamination, or presence of alkali basalt as component of downgoing slab. Sr isotopic data for high-K alkaline lavas suggest mantle origin. High ratio in Lake Toba rhyolite implies crustal origin)

Whitford, D.J., W. Compston, I.A. Nicholls & M.J. Abbott (1977)- Geochemistry of Late Cenozoic lavas from Eastern Indonesia: role of subducted sediments in petrogenesis. Geology (GSA) 5, p. 571-575.
(Late Cenozoic basalts N of Timor from Solor to Serua primitive tholeiitic, but associated more silicic rocks suggest involvement of continental crust or sediment)

Whitford, D.J. & P.A. Jezek (1979)- Origin of Late Cenozoic lavas from the Banda arc, Indonesia: trace element and Sr isotope evidence. Contributions to Mineralogy and Petrology 68, p. 141-150.

(Active arc located on what appears to be oceanic crust whereas associated subduction trench is underlain by continental crust. Recent lavas predominantly andesitic, tholeiitic in N to calc-alkaline varieties in S islands. High 87Sr/86Sr ratios in calc-alkaline lavas interpreted to result from mixing of sialic component with mantle derived component. Likely cause is subduction and melting of sea-floor sediments or continental crust)

Whitford, D.J. & P.A. Jezek (1982)- Isotopic constraints on the role of subducted sialic material in Indonesian island-arc magmatism. Geological Society of America (GSA) Bull. 93, 6, p. 504-513.
(In Banda Arc continental material (probably subducted sediments) appears to be subducting beneath volcanic arc that is underlain by oceanic crust)

Whitford, D.J. & I.A. Nicholls (1975)- Geochemistry of the volcanic rocks of the Sunda island arc of Indonesia. Exploration Geophysics 6, 2/3, p. 76-77. *(Abstract only)*
(Sunda volcanic arc from N of Sumatra, through Java, Bali, Lombok, Sumbawa, Flores, Lesser Sunda Islands, after which becomes Banda arc. Variety of tectonic environments. Sumatra crust ~40 km thick with Paleozoic granites. Benioff zone only to ~200 km. Beneath Java crust thinner and younger; oldest exposed rocks Mesozoic, and Benioff zone to ~600km beneath Java Sea to N. Further E, crust thinner (~15 km), oceanic in velocity structure and Benioff zone to great depths)

Whitford, D.J. & I.A. Nicholls (1976)- Potassium variation in lavas across the Sunda arc in Java and Bali. In: R.W. Johnson (ed.) Volcanism in Australasia, Elsevier, Amsterdam, p. 63-75.
Sunda arc of Java-Bali relatively simple tectonic setting above N-dipping Benioff seismic zone. Quaternary lavas of 'normal island arc association' (tholeiites to high-K calc-alkaline lavas) over Benioff zone depths from 120-250 km. High-K alkaline lavas above Benioff zone depths >300 km. Magmas derived mainly from mantle wedge above Beioff zone, where modified by water and/or melt from the subducted oceanic crust)

Whitford, D.J., I.A. Nicholls & S.R. Taylor (1979)- Spatial variations in the geochemistry of Quaternary lavas across the Sunda arc in Java and Bali. Contributions to Mineralogy and Petrology 70, 3, p. 341-356.
(online at: https://www.academia.edu/62507852/Spatial_variations_in_the_geochemistry_of_Quaternary_lavas_across_the_Sunda_arc_in_Java_and_Bali)
(Island arc lavas range from tholeiites to high-K calc-alkaline lavas over Benioff zone depths 120 to 250 km. More abundant calc-alkaline lavas between these extremes. High-K alkaline lavas over Benioff zone depths over 300 km. Incompatible elements increase with depth to seismic zone. Java and Bali lavas geochemistry best explained by combination of mantle source melting and partial melting of that material at progressively greater depths. Primary tholeiitic magmas may form by 20-25% melting at 30-40 km, primary high-K calc-alkaline magmas by 5-15% melting at 40-60 km, and primary alkaline magmas by 5% melting at 80-90 km)

Whitford, D.J. & W.M. White (1981)- Neodymium isotopic composition of Quaternary island arc lavas from Indonesia. Geochimica Cosmochimica Acta 45, p. 989-995.
(143Nd/144Nd ratios in Quaternary lavas from Java and Banda arc exhibit inverse correlation with 87Sr/86Sr. Indonesian samples resemble Andean rather than island arc lavas)

Williams, M. (2012)- The ~73 ka Toba super-eruption and its impact: history of a debate. Quaternary International 258, p. 19-29.

(Toba volcano in N Sumatra located at intersection of two major tectonic lineaments. Caldera considered the largest Quaternary caldera on earth. Most recent explosive eruption at ~73 ka was order of magnitude larger than Tambora in 1815. Extent of the impact remains unclear)

Williams, M. (2012)- Did the 73 ka Toba super-eruption have an enduring effect? Insights from genetics, prehistoric archaeology, pollen analysis, stable isotope geochemistry, geomorphology, ice cores, and climate models. Quaternary International 269, p. 87-93.
(Still ongoing debates on potential impact of ~73 ka Toba eruption (which probably produced almost 100 times more pyroclastic ejecta than Tambora in 1815))

Williams, M.A.J., S.H. Ambrose, S. van der Kaars, C. Ruehlemann, U. Chattopadhyaya, J. Pal & P.R. Chauhan (2009)- Environmental impact of the 73 ka Toba super-eruption in South Asia. Palaeogeogr. Palaeoclim. Palaeoecology 284, p. 295-314.
(Eruption of Toba volcano in N Sumatra at 73 ka was largest explosive eruption of past 2 My and caused cooling and deforestation in S Asia. Analysis of pollen from core in Bay of Bengal with stratified Toba ash suggest eruption was followed by cooling and prolonged desiccation, reflected in decline in tree cover in India and adjacent region. Carbon isotopic composition of soil carbonates above and below ash in three sites across C India show that C3 forest was replaced by wooded to open C4 grassland)

Wilson, M. & J.P. Davidson (1984)- The relative roles of crust and upper mantle in the generation of oceanic island arc magmas. Philosophical Transactions Royal Society London, A, 310, 1514, p. 661-674.
(Oceanic island arcs should represent least complicated type of subduction related magmatism, in which contamination by continental crustal materials does not occur. However, a range of basic-intermediate lavas from Sunda-Banda arc of Indonesia and Lesser Antilles island arc have significant continental fingerprint to their isotopic compositions, etc.. Could be explained by involvement of terrigenous sediment component in genesis of slab derived fluids. or could reflect high level contamination of ascending magmas by sediments at base of island arc crust)

Byrdina, S., H. Grandis, P. Sumintadireja, C. Caudron, D.K. Syahbana, E. Naffrechoux, H. Gunawan et al. (2018)- Structure of the acid hydrothermal system of Papandayan volcano, Indonesia, investigated by geophysical methods. J. Volcanology Geothermal Research 358, p. 77-86.

(Papandayan (2665m asl) stratovolcano 50 km from Bandung, W Java, characterized by intense hydrothermal activity. Acid hydrothermal plume delineated with Electrical Resistivity Tomography, etc. Main degassing zones in 1772 crater (Kawah Emas, Manuk, Kawah Baru) all connected to common reservoir at 100m depth (acid hydrothermal plume))

Camus, G., M. Diament, M. Gloaguen, A. Provost & P. Vincent (1992)- Emplacement of a debris avalanche during the 1883 eruption of Krakatau (Sunda Straits, Indonesia). GeoJournal 28, 2, p. 123-128.
(online at: https://www.researchgate.net/publication/226657987_Emplacement_of_a_Debris_Avalanche_during_the_1883_Eruption_of_Krakatau_Sunda_Straits_Indonesia)
(As argued by Camus & Vincent (1983), only a Mount St. Helens-type volcano collapse during eruption can account for all characteristics of 1883 Krakatau eruption and its deposits. Indonesian-French 1990 'Mentawai' marine survey confirms that sea bottom around Krakatau is covered by thick ignimbritic deposit, but also likely debris-avalanche deposit under ignimbrites, characterized by hummocky morphology to N, NW and E)

Camus, G., A. Gourgaud, P.C. Mossand-Berthommier & P.M.Vincent (2000)- Merapi (Central Java, Indonesia): an outline of the structural and magmatological evolution, with a special emphasis to the major pyroclastic events. J. Volcanology Geothermal Research 100, p. 139-163.
(Merapi Volcano history four periods: Ancient (40,000- 14,000 yrs BP), Middle, Recent (starting at 2200 yrs BP) and Modern Merapi (since eruption of 1786). Mount St. Helens-type edifice collapse during Middle Merapi stage between 6700- 2200 y BP. During Recent Merapi stage, violent magmatic to phreatomagmatic eruptions twice interrupted growth of volcano. Modern Merapi characterised by persistent growth of summit dome, y interrupted by collapses of dome to generate frequent Merapi-type nuees ardentes (blocks-and-ash flows and associated surges). Previous stages characterised by long lava flows, alternating with violent explosive phases. Merapi lavas calc-alkaline, with ~50-60% SiO2. 90% of Merapi lavas high-K basaltic andesites)

Camus, G., A. Gourgaud & P.M. Vincent (1987)- Petrologic evolution of Krakatau (Indonesia): implications for a future activity. J. Volcanology Geothermal Research 33, p. 299-316.
(Krakatau Volcano in Sunda straits characterized by phases, each beginning with construction of cone and ending with destruction and formation of caldera. Two last (pre- and post-1883) cycles well known, but older ones not clearly defined. Lava evolution shows cyclicity tied structural evolution, from basalts to basic andesites, acid andesites to dacites. Destructive stages correspond to dacitic terms. Anak Krakatau from 1927-1979 characterized by basalts and basic andesites, 1981 eruption close to dacitic)

(online at: https://link.springer.com/content/pdf/10.1186/s40623-025-02143-7.pdf)
(Young Ciremai volcano, W Java,with phreatic–phreatomagmatic eruptions from 1698 to 1951, but previous eruptions likely exhibited both magmatic and phreatomagmatic fragmentations)

Handini, E., T. Hasenaka, N.D. Barber, T. Shibata & Y. Mori (2022)- Geochemistry of shield stage basalts from Baluran volcano, East Java, Sunda arc. J.Applied Geology (UGM) 7, 2, p. 64-82.
(online at: https://jurnal.ugm.ac.id/jag/article/view/76532/35746)
(Basaltic lava flows from shield stage of Baluran, a Quaternary volcanic center N of Ijen in rear of Sunda Arc in E Java, with abundant plagioclase, clinopyroxene, olivine, and minor magnetite. Resemble other medium-K calc-alkaline basalts from E Java's volcanoes but less enriched in light ion lithophile elements and Pb)

Handini, E., T. Hasenaka, N.D. Barber, T. Shibata, Y. Mori & A. Harijoko (2024)- Systematics of slab-derived components in Central Java, Sunda Arc: evidence for differential material transfer across the Southeast Asian convergent margin. Tectonophysics 873, 230229, p. 1-17.
(Modern volcanoes represent cycling of material and heat along subduction zone. C Java volcanoes in Sunda arc portion of SE Asian convergent system. C Java volcanoes inherit geochemistry from silicate melts that formed due to hydrous melting of subducting slab at depths of ~136-272 km. Across-arc variations for five volcanoes arranged in N-S lineament across C Java show decreasing ratio of sediment/ altered oceanic crust from volcanic front (Merapi volcano) to rear-arc (Muria). Farther from trench, signature of subducting oceanic plate increases, peaking at around ~160-170 km of slab depth)

Handini, E., T. Hasenaka, A. Harijoko & Y. Mori (2017)- Variation of slab component in ancient and modern Merapi products: a detailed look into slab derived fluid fluctuation over the living span of one of the most active volcanoes in Sunda Arc. J. Applied Geology (UGM) 2, 1, p. 1-14.
(online at: https://jurnal.ugm.ac.id/jag/article/view/30253/18263)

(Holocene eruptions of Merapi medium-K calc alkaline before 1900 years ago and high-K after that. Change attributed to increasing subducting sediment input as volcano matures. Ancient Merapi samples higher input of slab derived fluid (1.5 % of sediment derived fluid) than 2006 eruption of Modern Merapi (opposite of suggested trend))

Handini, E., I.W. Warmada, T. Hasenaka, N.D. Barber & T. Shibata (2022)- Geochemistry of arc alkaline magmatism of Java Island, Sunda Arc: a statistical review. Proc. 13th AUN/SEED-Net Regional Conference Geological and Geo-Resource Engineering (RCGEOE), Yogyakarta 2021, IOP Conference Series: Earth and Environmental Science 1071, 012013, p. 1-9.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1071/1/012013/pdf)
(Alkaline magmatism developed in back arc area of Java (Sunda Arc), at different slab depths:~270-580 km in central section and ~150 km in E. Geochemical data from 4 alkaline volcanoes (Muria, Lasem, Bawean, Ringgit-Beser) suggests C Java alkalines highest K_2O and total alkali. Potassium and LILE enrichment independent of slab depth and more affected by arc segmentation in Java subduction zone)

Handley, H. (2006)- Geochemical and Sr-Nd-Hf-O isotopic constraints on volcanic petrogenesis at the Sunda arc, Indonesia. Ph.D. Thesis Durham University, p. 1-289.
(online at: http://etheses.dur.ac.uk/2670/)
(Geochem work on Salak, Gede, Idjen volcanoes shows progressive E-ward increase in Sr isotope ratio of volcanic rocks across W and C Java, broadly correlating with inferred lithospheric thickness (W Java thicker crust and more terrigenous signal of subducted sediment; E Java thin crust/ pelagic sediment). C- E Java transition may represent SE boundary of Sundaland (pre-Tertiary arc basement).

Handley, H.K., J. Blichert-Toft, R. Gertisser, C.G. Macpherson, S.P. Turner, A. Zaennudin & M. Abdurrachman (2014)- Insights from Pb and O isotopes into along-arc variations in subduction inputs and crustal assimilation for volcanic rocks in Java, Sunda arc, Indonesia. Geochimica Cosmochimica Acta 139, p. 205-226.
(online at: www.researchgate.net/publication/262690353_Insights_from_Pb_and_O_isotopes_into_alo Etc.)
(New Pb isotope data for volcanoes across Java (Gede, Salak, Galunggung, Merbabu, Merapi, Ijen). Negative correlation between Pb isotopes and SiO2, combined with mantle-like δ18O values in Gede explained by assimilation of-primitive arc rocks and/or ophiolitic crust known to outcrop in West Java. Peak in δ18O whole-rock and mineral values in C Java volcanic rocks (Merbabu and Merapi) combined with along-arc trends in Sr isotope ratios suggest different or additional crustal assimilant of C Java volcanic rock, likely carbonate material. Strong E-to-W Java variations in Ba concentration attributed subducted source input)

Handley, H.K., J.P. Davidson, C.G. Macpherson & J.A. Stimac (2008)- Untangling differentiation in arc lavas: constraints from unusual minor and trace element variations at Salak Volcano, Indonesia. Chemical Geology 255, p. 360-376.
(online at: www.academia.edu/30316299/Untangling_differentiation_in_arc_lavas_Constraints_from Etc.)
(Volcanic rocks from Salak Volcano, W Java show different minor and trace element geochemistry between central vent group lavas and rocks erupted at side vents)

Handley, H.K., C.G. Macpherson & J.P. Davidson (2010)- Geochemical and Sr-O isotopic constraints on magmatic differentiation at Gede Volcanic Complex (GVC), West Java, Indonesia. Contributions to Mineralogy and Petrology 159, 6, p. 885-908.
(manuscript online at: https://dro.dur.ac.uk/7502/1/7490.pdf)
(Sr-O isotopic data provide constraints on relative importance of fractional crystallisation and magma mixing in petrogenesis, as well as on role and nature of arc crust. Geochemical character of W Java arc crust relatively immature compared to typical continental crust. Trace element ratios and Sr isotopes show magmatic source of older geographical units (Gegerbentang, Older Quaternary) distinct from other GVC groups)

Handley, H.K., C.G. Macpherson, J.P. Davidson and R. Gertisser (2006)- Along-arc heterogeneity in crustal architecture and subduction input at the Sunda arc in Java, Indonesia. Geochimica Cosmochimica Acta 70, 18, Suppl. 1 (Goldschmidt Conference Abstracts), p. A227.

(Sunda Arc lavas across Java. Sr ratios increase from Krakatau in W to Merapi in C Java, but lower further E. Correlation between Sr ratio and volcano summit elevation indicates relation to lithospheric thickness. Other isotope ratios for W Java volcanics consistent with incorporation of subducted sediment dominated by terrigenous component. E Java volcanics greater involvement of subducted pelagic sediment and stronger slab-fluid imprint. Along-arc variation reflects decreasing thickness of turbidite deposits on down-going Indian Ocean lithosphere from Sumatra to Java)

Handley, H.K., C.G. Macpherson, J.P. Davidson, K. Berlo & D. Lowry (2007)- Constraining fluid and sediment contributions to subduction-related magmatism in Indonesia: Ijen Volcanic Complex. Journal of Petrology 48, 6, p. 1155-1183.
(online at: https://academic.oup.com/petrology/article-pdf/48/6/1155/16668761/egm013.pdf)
(Ijen Volcanic Complex in E Java developed on thickened oceanic crust. Caldera complex 20 km wide with 22 post-caldera eruptive centers. 'Old Idjen' volcanics unconformable on Miocene limestone. Lavas geochemistry suggest Ijen is least contaminated mantle wedge source analysed in region. Indian-type mid-ocean ridge basalt (I-MORB) -like fertile mantle wedge first infiltrated by minor fluid from altered oceanic crust, prior to addition of <1% subducted Indian Ocean sediment (pelagic ooze and Mn-nodules))

(online at: https://www.jstage.jst.go.jp/article/jdr/14/1/14_27/_pdf/-char/en)
(Kelud Volcano among most active volcanoes in Indonesia. Volumes of 1901, 1919, 1951, 1966, 1990, and 2014 eruptions estimated between 51-296 × 10^6 m3. Long-term mass discharge rate was estimated as ~1.5 × 10^{10} kg/year, relatively high compared to other basaltic-andesitic subduction-zone volcanoes)

Mandeville, C.W., S.H.S. Carey & J. King (1994)- Paleomagnetic evidence for high temperature emplacement of the 1883 subaqueous pyroclastic flows from Krakatau volcano, Indonesia. J. of Geophysical Research 99, B5, p. 9487-9504.
(1883 eruption of Krakatau volcano in Indonesia discharged >6.5 km^3 (dense rock equivalent) of pyroclastic material into Sunda Straits within 15km of volcano. Paleomagnetic evidence for high-emplacement T from pumice clasts from core of submarine pyroclastic deposits, showing mean inclination of ~24°, indicating cooling of clasts from >350°C after deposition)

Mandeville, C.W., S. Carey & H. Sigurdsson (1996)- Magma mixing, fractional crystallization and volatile degassing during the 1883 eruption of Krakatau volcano, Indonesia. J. Volcanology Geothermal Research 74, p. 243-274.
(Krakatau eruption of 1883 produced ~12.5 km3 of magma, 90% rhyodacite, 4% mafic dacite, 1% andesite and ~5% lithic material. Magma chamber compositionally and thermally zoned with upper part rhyodacite at T of 880-890 °C, overlying more mafic dacite at 890-913°C, and andesite at 980-1000°C)

Mandeville, C.W., S. Carey & H. Sigurdsson (1996)- Sedimentology of the Krakatau 1883 submarine pyroclastic deposits. Bulletin of Volcanology 57, 7, p. 512-529.
(Majority of tephra generated during 1883 eruption of Krakatau deposited in sea within 15 km of caldera. Thickest accumulation of tephra from eruption on submarine slopes W of Sertung (80m). Two submarine pyroclastic facies (1) massive, poorly sorted pumice and lithic lapilli-to-block sized fragments in silty-sandy ash matrix (indistinguishable from 1883 subaerial pyroclastic flow deposits; result of sinking of components of pyroclastic flows over water), (2) less common well-sorted, planar-laminated to low-angle cross-bedded, vitric-enriched silty ash, likely deposited from low-concentration pyroclastic density currents generated by shear between submarine flows and seawater)

Mandeville, C.W., A. Sasaki, G. Saito, K. Faure, R. King & E. Hauri (1998)- Open-system degassing of sulfur from Krakatau 1883 magma. Earth Planetary Science Letters, 160, 3-4, p. 709-722.
(Sulfur and oxygen isotopic data for tephra from August 1883 eruption of Krakatau. Sulfur isotopic ratios in unaltered tephra enriched in 34S relative to mantle sulfur. High values best be explained by open-system or multi-stage degassing of SO2 from oxidized rhyodacitic and gray dacitic magmas)

Marin, J., Y.M. Muhammad & T Winarno (2022)- Characteristics of volcanic rocks and associated intrusions based on petrography analysis in Jari-Krondonan Area, Bojonegoro Regency, East Java. Proc. 1st Int. Seminar on Earth Sciences and Technology (ISEST 2021), Bandung, IOP Conference Series: Earth and Environmental Science 1047, 012034, p. 1-10.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1047/1/012034/pdf)
(Pandan volcano one of dormant Quaternary volcanoes in E Java. Four andesitic intrusion centers which extend in N direction. Gabbro and metamorphic xenoliths Mount Lawang and Mount Watu, indicating interaction with country rock during rise of magma)

Marin, J., T. Winarno & D. Mindasar (2019)- Mineralogy and geochemistry variation of igneous rocks from Ungaran and Muria Volcano and Its processes related to subduction zone magmatism of Sunda Arc. Proc. Int. Conf. on Geoscience, Makassar 2018, IOP Conference Series: Earth and Environmental Science, 279, 012017, p. 1-9.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/279/1/012017/pdf)
(Igneous rocks from Ungaran and Muria volcanoes represent two different types of subduction magmatism: Ungaran typical volcanic arc basaltic andesite-andesite, Muria undersaturated, high-K calc alkaline-alkaline magma (confirming what has already been known for 50-100 years?; JTvG)

Marini, J.C. (2004)- L'Hafnium dans les zones de subduction: bilan isotopique des flux entrant et sortant. Doct. Sci. Thesis, Universite Joseph Fourier, Grenoble, p. 1-135.
(online at: www.iaea.org/inis/collection/NCLCollectionStore/_Public/37/095/37095281.pdf)
('Hafnium in subduction zones: isotopic record of incoming and outgoing flows'. Includes chapters on Hafnium isotopes in N Luzon and Late Eocene- Pleistocene volcanic arc lavas from Java, which appear very radiogenic, possibly caused by contamination of oceanic pelagic sediments in magma sources)

Maury, R.C., R. Soeria-Atmadja, R. Bellon, J.L. Joron, Y.S. Yuwono & E. Suparka (1987)- Nouvelles donnees geologiques et chronologiques sur le deux associations magmatiques du volcan Muria (Java, Indonesie). Comptes Rendus Academie Sciences, Paris, 304 (II), 4, p. 175-180.
('New geological and chronological data on the two magmatic associations of Muria volcano'. Two lava types in Pleistocene Muria volcano: young (0.6- 0.4 Ma) ultrapotassic leucite-bearing lavas and underlying leucite-free rocks, less rich in K (1.1- 0.6 Ma))

Minakami, T., T. Miyazaki & I. Surjo (1969)- Volcanological survey of Indonesian volcanoes- Part 1: Topographical change in the area near the summit crater of Mt. Merapii and and its geothermal survey. Bull. Earthquake Research Institute (University of Tokyo) 47, 5, p. 951-967.
(online at: https://repository.dl.itc.u-tokyo.ac.jp/records/33354)javascript:OnLinkClick('/record/33354/files/ji0475007.pdf', 33354, 'open_date')
(Brief review of historical changes in Merapi volcano crater area and new volcano observation in 1968. After Minakami's observations in 1941, seven new lava flows formed in 1948, 1953, 1954, 1956, 1957, 1961 and 1967. New temperature measurements mainly correspond to altitude of locations)

Mitsuoka, T., A. Toramaru, A. Harijoko & H.E. Wibowo, (2021)- Eruption types and conduit dynamics of Kukusan and Genteng volcanoes of the Ijen Volcanic Complex, Indonesia. Memoirs Faculty of Science, Kyushu University, D, Earth and Planetary Sciences 35, 1, p. 1-17.
(online at: https://api.lib.kyushu-u.ac.jp/opac_download_md/4371995/3501_p001.pdf)
(Eruption types of two monogenetic mafic volcanoes in Ijen volcanic complex: Kukusan volcano considered as sub-Plinian; Genteng is Strombolian. Kukusan scoria higher bubble number density and microlite crystallinity than Genteng, suggesting rapid magma ascent in volcanic conduit and higher magma viscosity, leading to a more explosive sub-Plinian eruption)

Moktikanana, M.L.A. & A. Harijoko (2022)- Reconnaissance study on the stratigraphy and characteristics of eruption products associated with basaltic caldera in Raung volcano, East Java, Indonesia. Proc. 13th AUN/SEED-Net Regional Conference Geological and Geo-Resource Engineering (RCGeoE 2021; online), IOP Conference Series: Earth and Environmental Science 1071, 012016, p. 1-11.

(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1071/1/012016/pdf)
(Raung volcano in E Java pre-historic devastating eruption evidenced by caldera at summit. Four pyroclastic fall deposits, two lava flows, ignimbrite, block and ash flow deposit, and lahar identified. Plinian eruption represented by layers of pumice fall, uncommon for an andesitic-basaltic stratovolcano)

Moktikanana, M.L.A., T. Ohba, A. Harijoko, H.E. Wibowo, M.A. Gurusinga & S.M. Cahyani (2024)- Geology, chronology, and temporal evolution of basaltic to dacitic magma system in Raung volcano, East Java, Indonesia. J. Volcanology Geothermal Research 452, 108126, p. 1-21.
(online at: https://www.sciencedirect.com/science/article/pii/S0377027324001185)
(Raung volcano in East Java (3332 m above s.l.) with magma composition from basalt to dacite. Frequently active from 1580-now. Radiocarbon dating of charcoal beneath tephra fall layers yield ages of major Plinian VEI-4 to VEI-5 eruptions were around 1200 CE and 1600 CE. Current volcanic activity mainly andesitic Strombolian eruption. Etc.)

Moktikanana, M.L.A., H.E. Wibowo, E. Rahayu & A. Harijoko (2021)- Hummock size and alignment in Gadung debris avalanche deposit, Raung Volcanic Complex, East Java, Indonesia. IOP Conference Series: Earth and Environmental Science 851, 012037, p. 1-16.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/851/1/012037/pdf)
(Debris avalanche deposit Gunung Gadung in Raung Volcanic Complex formed by failure of volcanic edifice. Collapse followed two main flow directions with different kinds of debris avalanche, i.e., freely spreading and valley filling. No significant correlation between hummock size and distance from source)

Muhammad, A.E.P., M. Abdurrachman, N. Kartadinata & W.F. Banggur (2025)- Petrogenesis of Sadakeling-Karaha Volcanic Complex, Tasikmalaya, West Java, Indonesia: Argoland contamination. Proc. 1st Int. Conference of Petroleum Mining Geology Geoscience Energy & Environmental Technology (ICPMGET), Jakarta 2024, IOP Conference Series: Earth and Environmental Science 1451, 012021, p. 1-9.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1451/1/012021)
(Sadakeling-Karaha Volcanic Complex N of Galunggung in W Java categorized as Volcanic Arc Basalt. Strong influence of continental crust suggests part of active continental margin, with contamination from Sundaland crust in N and Gondwana in S. Trace element Sr and Nd suggest link with SE Australian Granite)

Muller, M., A. Hordt & F.M. Neubauer (2002)- Internal structure of Mount Merapi, Indonesia, derived from long-offset transient electromagnetic data. J. of Geophysical Research 107, B9, p. 2187.
(Long-offset transient electromagnetic survey gave 2 resistivity profiles (10 km E-W and 15 km S-N) of Merapi volcano, C Java. Extensive conductive layer at depths of 1-2 km, probably caused by fluids)

Mulyadi, E. (1992)- Le complexe de Bromo-Tengger (Est Java, Indonesie): etude structurale et volcanologique. Doct. Thesis Universite Blaise Pascal, Clermont Ferrand, France, p. 1-152. *(Unpublished)*

Hosted by C.E. Stehn and other personnel of the 'Vulkaandienst' in Bandung. Results of Zies'analyses never fully published)

Zirkel, F. (1875)- Leucitbasalt von Gunung Bantal Susum auf der Insel Bawean bei Java. Neues Jahrbuch Mineralogie Geologie Palaontologie 1875, p, 175-176.
(online at: https://www.zobodat.at/pdf/Neues-Jb-Min-Geol-Palae_1875_0171-0224.pdf)

('Leucite basalt from the island Bawean near Java'. Brief January 1875 letter about first discovery of leucite-bearing basalts outside Europe, from Gunung Bantal Susum on Bawean island, Java Sea. In collection of Zirkel's recently deceased brother-in-law Prof. H. Vogelsang in Delft. (leucite basalts later also found in Gunung Muriah and Ringgit in NE Java, SW Sulawesi, etc.; JTvG))

Zollinger, H. (1844)- Togt naar den Salakh, op den tweeden tot vierden en vijftienden tot negentienden November, 1843. Tijdschrift voor Nederlandsch-Indie 6, 1, p. 141-176 and 7?, 3, p. 37-61.
('Trip to the Salak volcano on 2-4 and 15-19 November 1843'. Rel. comprehensive early geographic and botanical description of Salak volcano, W Java, after earlier surveys by Reinwardt, Kuhl, Van Hasselt, Hasskarl and Junghuhn (Zollinger's pioneering work was 'inexcusably ignored' in later papers by Junghuhn (Wichmann, 1896))

Zulkarnain, I. (2003)- Petrographic evidence for magma mixing beneath the Krakatau volcano and its implication for eruption magnitude and its mechanism: A preliminary view. J. RISET Geologi dan Pertambangan (LIPI) 13, 1, p. 1-11.
(Explosive eruption of Krakatau in August 1883 took place when magma composition reached dacitic stage, after change basaltic through andesite into dacite ('normal cycle of Krakatau eruptions'). Petrography suggests magma mixing and seismic data suggest two different magma chambers below Krakatau, suggesting changes in magma composition result of magma mixing, not fractionation processes)

X. INDONESIA- SE ASIA: MODERN ENVIRONMENTS, CARBONATES

(Numerous other papers on Recent environments and sediments and Oceanography that could be listed here but are tied to more specific sub-areas in Indonesia, may be listed under those areas)

X.1. Quaternary/Recent deposits and environments- shallow: Deltas, Tsunami deposits, Climate

Adhiperdana, B.G. Hendarmawan, K. Shibata & M. Ito (2018)- Relationships between discharge parameters and cross-sectional channel dimensions of rivers in an active margin influenced by tropical climate: The case of modern fluvial systems in the Indonesian islands. Catena 171, p. 645-680.
(Compilation of hydrological data from 649 river sites on Java, Sumatra, and Kalimantan, establishing relationships between discharge/bankfull channel width, (2) depth/ bankfull channel width, etc.)

Ai, L., S. Liu, S. Cong, H. Zhang, P. Cao, K. Wu, W. Ye, C.A. Rahim Mohamed & X. Shi (2024)- Spatial variability of surface sediments in the Malacca strait and its implications for sedimentary environments. J. Asian Earth Sciences 259, 105922, p. 1-10.
(Sediment samples from 1130km long Malacca Strait, between Malay Peninsula and Sumatra, connecting Andaman Sea with S China Sea. Residual sediments are coarsest sediments and concentrated in central region of Strait; modern terrigenous sediments distributed along coast of Malaysia and broad N region of Strait)

Ai, L., S. Liu, H. Zhang, P. Cao, X. Wu, L. He, W. Qi, K. Wu, C.A.R. Mohamed, H. Wang & X. Shia (2025)- Evolutionary history of the Malacca Strait driven by sea level changes since the last deglaciation. Global and Planetary Change 246, 104731, p.
(preprint online at: https://papers.ssrn.com/sol3/papers.cfm?abstract_id=4954987)
(Opening of Malacca Strait occurred at ~10 ka. A modern strait environment was established at ~7 ka. Sea level is the first-order control of recent sedimentary evolution in Malacca Strait)

Aldrian, E. & R.D. Susanto (2003)- Identification of three dominant rainfall regions within Indonesia and their relationship to sea-surface temperature. Int. J. Climatology 23, p. 1435-1452.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/joc.950/epdf)
(Three rainfall regions in Indonesia, related to island topography and sea-surface Temperature variability: (A) S Indonesia (S Sumatera to Timor, S Kalimantan, Sulawesi and part of Irian Jaya); (B) NW Indonesia (N Sumatra to NW Kalimantan); (C) Maluku and N Sulawesi. All with strong annual and (except A) semi-annual variability. Region C strongest El Nino- Southern oscillation influence)

Alongi, D.M., M. da Silva, R.J. Wasson & S. Wirasantosa (2013)- Sediment discharge and export of fluvial carbon and nutrients into the Arafura and Timor Seas: a regional synthesis. Marine Geology 343, p. 146-158.
(Islands of Timor and New Guinea significant sources of sediment. Most material delivered into Arafura and Timor Seas comes from New Guinea. Island and continental materials overlap with volcanic input from Banda Arc. Discharge from New Guinea and Timor greater than from N Australia)

Alongi, D.M., L.A. Trott, F. Tirendi, A.D. McKinnon & M.C. Undu (2008)- Growth and development of mangrove forests overlying smothered coral reefs, Sulawesi and Sumatra, Indonesia. Marine Ecology Progress Ser. 370, p. 97-109.
(Human-induced shifts from fringing reef-dominated to mangrove-dominated coastal habitats in S Sumatra and SW Sulawesi)

Amijaya, H. & Ngisomuddin (2007)- Textural characteristics of tsunamiite: study on recent tsunami deposit at Pangandaran coast, Ciamis and Parendog coast, Yogyakarta. Proc. Joint Convention 32nd HAGI, 36th IAGI and 29th IATMI, Bali, p. 1103-1109.
(online at: https://www.iagi.or.id/web/digital/28/2007_IAGI-Bali_Textural-Characteristics-of-Tsunamiite.pdf)
(Recent tsunamiites of Java S coast have erosional base, homogeneous m-f sand grain size and no fining-upward trend. Sedimentary structures parallel lamination in lower part and ripples in upper part)

Arp, G., A. Reimer & J. Reitner (2003)- Microbialite formation in seawater of increased alkalinity, Satonda Crater Lake, Indonesia. Journal of Sedimentary Research 73, p. 105-127.
(Crater lake of Satonda, a small volcanic island 3 km NW of Sumbawa, with red-algal microbial reefs in marine-derived water of increased alkalinity. Potential analogue for ancient microbialites in open-marine facies)

Arp, G., J. Reitner, G. Worheide & G. Landmann (1996)- New data on microbial communities and related sponge fauna from the alkaline Satonda crater lake (Sumbawa, Indonesia). Gottinger Arbeiten Geologie Palaeontologie, Sonderband SB2, p. 1-7.
(Crater lake of Satonda, a small volcanic island 3 km NW of Sumbawa, with high-alkaline water. With well-developed 'stromatolitic' red algal- microbialite reefs with demosponges in upper ~20m)

Ashton, P.S. (2014)- On the forests of tropical Asia- lest the memory fade. Royal Botanic Gardens Kew and Arnold Arboretum, Harvard University, p. 1-670.

Ashton, P.S. (2017)- Patterns of variation among forests of tropical Asian mountains, with some explanatory hypotheses. Plant Ecology Diversity 10, 5-6, p. 361-377.
(online at: https://www.tandfonline.com/doi/abs/10.1080/17550874.2018.142902)
(Review of modern forests zonation in tropical Asia: lowland forests, lower montane forests, upper montane forests, subalpine thicket/ shrublands)

Aswan & Y. Rizal (2021)- Identification of suspected paleotsunami deposits study from Karapyak Beach, Pangandaran area, West Jawa, Indonesia. Bulletin of the Marine Geology, 36,2, p. 75-83.
(online at: https://media.neliti.com/media/publications/381443-none-f1ee23b1.pdf)
(Karapyak Beach near Pangandaran, SW Java, paleotsunami deposit light brown loose sand overlying a dark brown paleosoil layer with erosional contact. Base of lower part rich with broken mollusc shells and corals, the mid-top of lower part may contain several intact mollusc shells and corals, rock fragments and anthropogenic products. Foraminifera mixture of shallow and deep marine species)

Bachtiar, A., M. Reza, A. Krisyunianto & Y.S. Purnama (2011)- Sedimentology of Kalianyar Delta, Indramayu, Northwest Java basin: uniques tidal and wave interaction in a supposedly river dominated delta. Proc. Joint 36th HAGI and 40th IAGI Annual Conv., Makassar, JCM2011-470, p. 1-15.
(online at: https://www.iagi.or.id/web/digital/10/2011_IAGI_Makassar_Sedimentology-of-Kalianyar-Delta.pdf)
(Kalianyar Delta modern delta on N coast of Indramayu, NW Java. Morphologically classified as river-dominated 'bird-foot' delta, but field survey common influence of wave and tidal processes)

Bachtiar, A., J. Wiyono, Liyanto, M. Syaiful, Y.S. Purnama et al. (2010)- , cores, and salinity. Proc. HAGI-SEG International Geosciences Conference, Bali 2010, IGCE10-OP-009, p. 1-10.
(Modern Mahakam delta sediments study. Most channel thalwegs devoid of sands; grab samples usually found semi-consolidated clay instead. Active sand transportation and deposition on slopes of point bars and side bars. Shallow cores in lower delta plain generally characterized by clay drapes, suggesting tidal processes)

Baker, E.K., P.T. Harris, J.B. Keene & S.A. Short (1995)- Patterns of sedimentation in the macrotidal Fly River delta, Papua New Guinea. In: B.W. Flemming & A. Bartholomae (eds.) Tidal signatures in modern and ancient sediments, Int. Association of Sedimentologists (IAS), Special Publ. 24, p. 193-211.

Benzerara, K., A. Meibom, Q. Gautier, J. Kazmierczak, J. Stolarski et al. (2010)- Nanotextures of aragonite in stromatolites from the quasi-marine Satonda crater lake, Indonesia. In: H.M. Pedley & M. Rogerson (eds.) Tufas and speleothems: unravelling the microbial and physical controls, Geological Society, London, Special Publ. 336, p. 211-224.
(On composition and texture of aragonite in lacustrine stromatolites from alkaline crator lake of Satonda)

Bird, E.C.F. & O.S.R. Ongkosongo (1980)- Environmental changes on the coasts of Indonesia. The United Nations University, United Nations University Press, Tokyo, p. 1-55.
(online at: www.unu.edu/unupress/unupbooks/80197e/80197E00.htm)

(Overview of coastal progradation along various coastlines of Indonesia)

Bird, M.I., D. Taylor & C.Hunt (2005)- Palaeoenvironments of insular Southeast Asia during the last glacial period; a savanna corridor in Sundaland? Quaternary Science Reviews 24, 20-21, p. 2228-2242.
(online at: https://www.researchgate.net/publication/313759617_Paleoenvironments_of_insular_Southeast_Asia_during_the_last_glacial_period_A_savanna_corridor_in_Sundaland)
(Geomorphology, palynology, biogeography and vegetation/climate modelling suggests N-S 'savanna corridor' through Sundaland continent at Last Glacial Period at time of lowered sea-level. Minimal interpretation of 50-150 km wide zone of open savanna vegetation along divide between S China and Java Seas, forming land bridge between Malay Peninsula, Sumatra, Java and Borneo and served as barrier to dispersal of rainforest- dependent species between Sumatra and Borneo. Savanna corridor may have provided convenient route for rapid early dispersal of modern humans through region and on into Australasia)

Brown, I.M. (1990)- Quaternary glaciations of New Guinea. Quaternary Science Reviews 9, p. 273-280.
(New Guinea mountains covered by glaciers at ~300 ka and at ~700 ka. Mean annual T was at least 6-7°C lower. Glaciers receded by 13 ka BP and New Guinea may have been ice free by 7 ka. Glaciers developed again at ~5 ka. At least four significant re-advances during last 3.5 ka. Little Ice Age ended 120-150 years ago and glaciers retreating to present day)

Brune, S., A.Y. Babeyko, S. Ladage & S.V. Sobolev (2010)- Landslide tsunami hazard in the Indonesian Sunda Arc. Natural Hazards Earth System Sciences 10, p. 589-604.
(online at: https://www.nat-hazards-earth-syst-sci.net/10/589/2010/nhess-10-589-2010.pdf)
(Review of tsunamigenic events triggered by submarine landslides. Largest documented recent slides (SE of Sumba, etc.) volume of 15-20 km^3. Many large tsunamigenic landslides ultimately triggered by earthquakes)

Brune, S., S. Ladage, A.Y. Babeyko, C. Muller, H. Kopp & S.V. Sobolev (2009)- Submarine landslides at the eastern Sunda margin: observations and tsunami impact assessment. Natural Hazards 54, 2, 547-562.
(online at: http://edoc.gfz-potsdam.de/gfz/get/14283/0/b800b700926b1f854f8f70c2e84b0c4a/14283.pdf)
(New bathymetric data show six large submarine slides at E Sunda margin between C Java and Sumba. Volumes between 1 km^3 in Java fore-arc basin up to 20 km^3 at trench off Sumba and Sumbawa)

Caline, B. & J. Huong (1992)- New insights into the recent evolution of the Baram Delta from satellite imagery: Bull. Geological Society Malaysia 32, p. 1-13.
(online at: https://gsmpubl.files.wordpress.com/2014/09/bgsm1992012.pdf)

Cannon, C.H., R.J. Morley & A.B.G. Bush (2009)- The current refugial rainforests of Sundaland are unrepresentative of their biogeographic past and highly vulnerable to disturbance. Proc. National Academy of Sciences USA (PNAS) 106, 27, p. 11188- 11193.
(online at: www.pnas.org/content/early/2009/06/18/0809865106.full.pdf)
(Model reconstruction of forest types across exposed Sunda Shelf during Pleistocene Last Glacial Maximum, suggesting rainforests covered substantially larger area than today (see also Wurster et al. 2010 who argued for more savannah vegetation; JTvG))

Cecil, C.B., F.T. Dulong, J.C. Cobb & Supardi (1993)- Allogenic and autogenic controls on sedimentation in the Central Sumatra basin as an analogue for Pennsylvanian coal-bearing strata in the Appalachian basin. In: J.C. Cobb & C.B. Cecil (eds.) Modern and ancient coal-forming environments, Geological Society of America (GSA), Special Paper 286, p. 3-22.
(Modern influx of fluvial sediment to Sunda shelf/ Strait of Malacca from Sumatra restricted by rain forest cover in equatorial ever-wet climate belt. Much of marine and estuarine environments erosional or non-depositional, except for localized deposition in slack water areas, such as downstream end of islands. Thick (>13m), laterally extensive (>70,000 km^2) peat deposits forming on poorly drained coastal lowlands)

Cecil, C.B., F.T. Dulong, R.A. Harris, J.C. Cobb, H.G. Gluskoter & H. Nugroho (2003)- Observations on climate and sediment discharge in selected tropical rivers, Indonesia. In: C.C Blaine et al. (eds.) Climate controls on stratigraphy, Soc. Sedimentary Geology (SEPM), Special Publ. 77, p. 29-50.
(Factors influencing fluvial sediment discharge include catchment-basin size, relief, gradient, tectonic setting, bedrock lithology, rainfall. Dominant variable affecting fluvial sediment discharge among islands of Indonesia appears to be seasonality in rainfall, regardless of tectonic setting, relief or catchment-basin size)

Chabangborn, A., K.K.A. Yamoah, S. Phantuwongraj & M. Choowon (2018)- Climate in Sundaland and Asian monsoon variability during the last deglaciation. Quaternary International 479, p. 141-147.
(Warming S Hemisphere caused S-ward shift of Intertropical Convergent Zone (ITCZ) and weakened summer monsoon in Asian monsoon region between 18.5- 15 ka BP. Warmer N Hemisphere strengthened summer monsoon intensity in Asian monsoon region and moved ITCZ to N between 15 and 13.5 ka BP, Opposing precipitation pattern between E and Wt Indian Ocean suggested potential influence of Walker circulation on the Sundaland climate from 13.5-11 ka BP)

Chapkanski, S., G. Brocard, F. Lavigne, T. Afrizal, E. Meiliand, N. Ismail, J. Majewski et al. (2025)- Mid-to late-Holocene fluvial and coastal evolution in the Aceh River delta, Sumatra: effects of sea-level change, sediment supply, wave climate, tectonics and tsunamis. Quaternary Science Advances 19, 100290, p. 1-18.
(online at: https://www.sciencedirect.com/science/article/pii/S2666033425000267)
(On processes affecting growth of Aceh River delta at NW-most tip of Sumatra during last 6 kyrs. Formed in NW-SE trough basin along trace of the Great Sumatran fault)

Clift, P.D. (2006)- Controls on the erosion of Cenozoic Asia and the flux of clastic sediment to the ocean. Earth Planetary Science Letters 241, p. 571-580.
(Rates of continental erosion reconstructed from volumes of clastic sediment, most of which offshore. Sediment flux from mainland Asia first peaked in E-M Miocene (24-11 Ma), well before initiation of glacial climate, indicating that rock uplift and precipitation are key controls on erosion over long periods of time. In E Asia faster erosion correlates with more humid, warm climates in E-M Miocene, changing to less erosive, drier climates after 14 Ma when Antarctic glaciation begins. Average sedimentation rates on most E Asian continental margins since 1.8 Ma 5-6 times less than modern fluvial flux)

Clift, P.D. (2020)- Asian monsoon dynamics and sediment transport in SE Asia. J. Asian Earth Sciences 195, 104352, p. 1-11.
(Asian monsoon is dominant climatic phenomenon in SE Asia, responsible for most regional precipitation. Strong monsoons associated with intensified reworking of pre-existing floodplain sediments over millennial timescales, and deliver/ deposition more sediment than during more arid times. Over longer time periods strengthening of monsoon linked to faster bedrock erosion and increased sediment flux of ocean.Over long time periods, monsoon is subsidiary to effects of global cooling at least since M Miocene)

Clift, P.D. & R.A. Plumb (2008)- The Asian monsoon: causes, history and effects. Cambridge University Press, p. 1-288.
(Asian monsoon large-scale seasonal reversal of normal atmospheric circulation pattern. Low-pressure systems develop in tropics due to rising hot air that cools and descends in subtropics (arid regions). In contrast, summer heating of Asian continent (mainly Tibetan Plateau) generates low-pressure cells and summer rains in S and E Asia. In winter reversed high-P system established, with dry, cold winds blowing out of Asia. Monsoon intensity varies in 21, 40 and 100 thousand year timescale, with periods of glacial advance and retreat: summer monsoons strong and winter monsoons weaker during warm, interglacial periods (reverse in glacial times))

Coleman, J.M., S.M. Gagliano & W.G. Smith (1970)- Sedimentation in a Malaysian high tide tropical delta. In: J.P. Morgan & R.H. Shaver (eds.) Deltaic sedimentation, modern and ancient. Soc. Economic Min. Paleont. (SEPM), Special Publ. 15, p. 185-197.

Griffiths, M.L., R.N. Drysdale, M.K. Gagan, J.X. Zhao, J.C. Hellstrom, L.K. Ayliffe & W.S. Hantoro (2013)- Abrupt increase in East Indonesian rainfall from flooding of the Sunda Shelf ~9500 years ago. Quaternary Science Reviews 74, p. 273-279.
(Stalagmite record from Liang Luar Cave, Flores, suggests rapid increase in Indonesian monsoon rainfall at ~9.5 ka, synchronous with rapid expansion of rainforest in NE Australia, regional freshening of S Makassar Strait and ~1.5 °C cooling in upper thermocline of Timor Sea, indicative of reduced surface heat transport by Indonesian Throughflow when Java Sea opened during postglacial sea-level rise. Increase in monsoon rainfall tied to sudden increase in ocean surface area and/or temperature in monsoon source region as Sunda Shelf flooded during deglaciation)

Gugliotta, M., Y. Saito, V.L. Nguyen, T.K.O. Ta, T. Tamura & S. Fukuda (2018)- Tide- and river-generated mud pebbles from the fluvial to marine transition zone of the Mekong River delta, Vietnam. Journal of Sedimentary Research 88, 9, p. 981-990.
(Mud clasts present in most samples from channel in Mekong River and Delta channels. Formed by erosion of previously deposited fluvial and tidal mud layers)

Gupta, A. (ed.) (2005)- The physical geography of Southeast Asia. Oxford University Press, Oxford, p. 1-440.

Haberle, S.G. (2003)- The emergence of an agricultural landscape in the highlands of New Guinea. Archaeology in Oceania 38, 3, p. 149-158.
(Pollen and sedimentological evidence in highlands of New Guinea, from 5 sites from highland valleys (1400-1890m altitude), covering period from Last Glacial Maximum (22 ka) to Present. Earliest indications of agricultural impact in vegetation record around 7800 cal BP. Subsequent vegetation change reflects increases in anthropogenic impact, punctuated by peak episodes of vegetation change towards more open landscape. Emergence of an agricultural landscape in New Guinea is seen as a result of gradual indigenous development)

Haberle, S.G., G.S. Hope & Y. Defretes (1991)- Environmental change in the Baliem Valley, montane Irian Jaya, Republic of Indonesia. J. of Biogeography 18, p. 95-40.
(online at: www.academia.edu/17017366/Environmental_Change_in_the_Baliem_Valley_Montane_I Etc.)
(Floor of the Baliem Valley, at ~1420- 1600m altitude and montane tropical climate, largely cleared and initial date for burning and slope degradation is 26,000 yr BP, based on charcoal in slope wash. Pollen and magnetic analyses show high level of human disturbance since that time. Casuarina widely grown after 2900 yr BP)

Hanebuth, T.J.J., U. Proske, Y. Saito, V. Nguyen & K. Thi (2012)- Early growth stage of a large delta-transformation from estuarine-platform to deltaic-progradational conditions (the northeastern Mekong River Delta, Vietnam). Sedimentary Geology 261-262, p. 108-119.
(Mekong Delta early delta growth during transgression-related inundation between 8 ka BP (maximum flooding) and 5.7 ka BP (sea-level highstand), characterized by tide-and marine-influenced nearshore conditions with extensive mangrove and tidal-flat deposits aggrading on wide abrasion platform. Onset of regression/ progradation at ~4.8 ka)

(Deposition of suspended sediment in shallow coastal waters colonized by Thallasia-dominated seagrass in Pannikiang Island measured with sediment traps. Amounts of sediment deposition inside seagrass beds significantly higher than in adjacent unvegetated area)

Liu, J.P., D.J. DeMaster, T.T. Nguyen, Y. Saito, V.L. Nguyen, T.K.O. Ta & X. Li (2017)- Stratigraphic formation of the Mekong River Delta and its recent shoreline changes. In: Sedimentation and survival of the Mekong Delta, Oceanography 30, 3, p. 72-83.
(online at: https://tos.org/oceanography/assets/docs/30-3_liu.pdf)
(Mekong River discharges into S China Sea and formed third largest delta plain in world (~50,000 km^2; after Amazon and Ganges-Brahmaputra). Subaerial delta prograded ~220 km SE-ward in last 7500 years, showing 15m thick sigmoidal clinoforms immediately off distributaries. Mekong-derived sediment extends ~300 km along shelf to SW. From 1973- 2005 seaward shoreline growth decreased gradually, due to construction of dams, sand mining, delta subsidence, increasing storms and sea level rise)

Liu, Z., H. Wang, W.S. Hantoro, E. Sathiamurthy, C. Colin, Y. Zhao & J. Li (2012)- Climatic and tectonic controls on chemical weathering in tropical Southeast Asia (Malay Peninsula, Borneo, and Sumatra). Chemical Geology 291, p. 1-12.
(Clay mineralogy and major element geochemistry of 58 surface sediment samples in 27 rivers draining Malay Peninsula, Borneo, and Sumatra. High kaolinite in Malay Peninsula (av. 80%), Sumatra (58-78%), and S Borneo (41-55%), high illite in N Borneo (47-77%), moderate smectite in Sumatra (6-29%). Intensive chemical weathering in all three regions, increasing from N Borneo to S Borneo, and further to Malay Peninsula and Sumatra. Monsoon climate with constant warm temperature and abundant precipitation principal forcing factor on chemical weathering)

Lyu, H., T. Watanabe, Y. Ota, A. Hartono, M. Anda, R.A. Dahlgren & S. Funakawa (2022)- Climatic controls on soil clay mineral distributions in humid volcanic regions of Sumatra and Java, Indonesia. Geoderma 425, 116058, p. 1-13.
(Climate and parent material primary factors determining distributions of soil clay minerals. In Sumatra-Java large variations in climate (T, precipitation/ intensity of dry season) and parent material (rhyolitic-to-basaltic tephra).High Fe(hydr) oxide in soils derived from mafic materials. Occurrence of mica, altered to hydroxy-Al interlayered vermiculite, under continuous leaching conditions in soils from felsic materials)

Mann, T., A. Rovere, T. Schoene, A. Klicpera, P. Stocchi, M. Lukman & H. Westphal (2016)- The magnitude of a mid-Holocene sea-level highstand in the Strait of Makassar. Geomorphology 257, p. 155-163.

(Literature suggests two relative sea-level highstands over last 6000 years, with magnitudes >2m, but emergent fossil microatolls on Pulau Panambungan, Spermonde Shelf, indicate relative sea-level highstand not >0.5 m above present at ~5600 yr BP. Highstand followed by rapid sea-level fall to present level at ~4000 cal. yr BP)

Milliman, J.D. (1995)- Sediment discharge to the ocean from small mountainous rivers: the New Guinea example. Geo-Marine Letters 15, p. 127-133.
(Small mountainous rivers draining island of New Guinea discharge approximately 1.7 × 109 t of sediment annually, about same as combined loads of rivers draining N America)

Milliman, J.D., K.L. Farnsworth & C.S. Albertin (1999)- Flux and fate of fluvial sediments leaving large islands in the East Indies. J. of Sea Research 41, 1-2, p. 97-107.
(Rivers on Sumatra, Java, Borneo, Sulawesi, Timor and New Guinea relatively high sediment discharge. These six islands only 2% of land area draining into global ocean, but responsible for 20-25% of sediment export)

Minoura, K., F. Imamura, T. Takahashi & N. Shuto (1997)- Sequence of sedimentation processes caused by the 1992 Flores tsunami: Evidence from Babi Island. Geology (GSA) 25, 6, p. 523-526.
(1992 Flores tsunami caused widespread deposition of coarse and well-sorted marine carbonate sand with molluscan shells sand on N and SSW shores of Babi Island)

Molengraaff, G.A.F. (1930)- The recent sediments in the seas of the East Indian Archipelago with a short discussion of those seas in former geological periods. Proc. Fourth Pacific Science Congress, Java 1929, IIA, p. 989-1021.

Molnar, P. & T.W. Cronin (2015)-- Growth of the Maritime Continent and its possible contribution to recurring Ice Ages. Paleoceanography and Paleoclimatology (AGU) 30, 3, p. 196-225.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1002/2014PA002752)
(Areal extent of the 'Maritime Continent' (= islands of Indonesia and surrounding region) has grown by ~60% since 5 Ma, which may have altered global climate in two ways: (1) heavier rainfall over islands and (2) increased area of weathering of basaltic rock under warm, moist conditions extracts more CO_2 from atmosphere, possibly lowering global temperatures by 0.25°C)

Morley, R.J. & H. Morley (2021)- The prelude to the Holocene: tropical Asia during the Pleistocene. In: N. Kumaran & D. Padmalal (eds.) Holocene Climate Change and Environment, Elsevier, Chapter 1, p. 1-32.
(Review of Quaternary climate in India and SE Asia. SE Asian rainforest flora largely derived from India, as it collided with Asia in Eocene, and many elements of Southeast Asia's fauna dispersed from India during late Neogene. For last and penultimate glacial periods, increasing evidence for seasonally dry conditions in different parts of Sundaland. Etc.).

(Most recent deglaciation resulted in global sea-level rise of ~120 m over 12 000 years. Numerical model is developed to predict response of rivers to this rise)

Payenberg, T.H.D., S.C. Lang & B. Wibowo (2003)- Discriminating fluvial from deltaic channels- examples from Indonesia. Proc. 29th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 1-16.
(Fluvial channel reservoirs most commonly meander pointbars or braided sheets. Deltaic distributary channel reservoirs typically elongate sandy channel sidebars attached to straight channel walls. Deltaic distributary channels usually thinner and shallower than fluvial channel belts, and not thicker than their depositional

mouthbars. Width-thickness ratios for fluvial distributary channel reservoirs average 50:1, meandering fluvial channel reservoirs have width-thickness ratios typically >100:1, braided river reservoirs 500:1 or higher)

Pilarczyk, J.E., T. Dura, B.P. Horton, S.E. Engelhart, A.C. Kemp, Y. Sawai (2014)- Microfossils from coastal environments as indicators of paleo-earthquakes, tsunamis and storms. Palaeogeogr. Palaeoclim. Palaeoecology 413, p. 144-157.
(Discussion of storm- and tsunami-related transport, with examples from Thailand, Malaysia, etc. Paleotsunami deposits commonly recognized as anomalous sand sheets that were washed into marsh or lake sediments. Marine microfossils often dominate tsunami overwash deposits because of landward transport and deposition of scoured marine sediment. Nearshore benthic foraminifera (Ammobaculites spp., Ammonia, etc.) may also be entrained by tsunami run-up and subsequently transported seaward by backwash, where they end up as allochthonous assemblages in low-energy submarine sediments)

Prentice, M.L. & S. Glidden (2010)- Glacier crippling and the rise of the snowline in western New Guinea (Papua Province, Indonesia) from 1972 to 2000. In: S.G. Haberle et al. (eds.) Altered ecologies: fire, climate and human influence on terrestrial landscapes, ANU Press, p. 457-472.
(From 1936 to 2006, the area of the Meren/Carstensz glacial system of W Papua decreased by 78%)

Prentice, M.L., G.S. Hope, K. Maryunani & J.A. Peterson (2005)- An evaluation of snowline data across New Guinea during the last major glaciation, and area-based glacier snowlines in the Mt. Jaya region of Papua, Indonesia, during the last glacial maximum. In: S.P. Harrison (ed.) Snowlines at the last glacial maximum and tropical cooling, Quaternary International 138-139, p. 93-117.
(Data from Puncak Jaya show Last Glacial Maximum glaciation less extensive than previously thought)

Proske, U., T.J.J. Hanebuth, H. Behling, V.L. Nguyen, T.K.O. Ta & B.P. Diem (2010)- The palaeoenvironmental development of the northeastern Vietnamese Mekong River Delta since the mid Holocene. The Holocene 20, 8, p. 1257-1268.
(online at: http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.918.2627&rep=rep1&type=pdf)
(During the mid-Holocene when sea level was between ~2.5-4.5 m above present level, broad mangrove belts (Rhizophora pollen, Avicennia, Sonneratia, Bruguiera, etc.) along numerous coasts of Sunda and Sahul shelves. With subsequent seaward migrating shoreline gradually replacement by back-mangroves)

Proske, U., T.J.J Hanebuth, J. Groger & B.P. Diem (2011)- Late Holocene sedimentary and environmental development of the northern Mekong River Delta, Vietnam. Quaternary International 230, p. 57-66.
(Sedimentological and palynological study of sediment cores from N Mekong River Delta show delta development since M-Holocene sea level highstand. M Holocene Sub- to intertidal flat deposit followed by late Holocene regression and delta progradation)

Raes, N., C.H. Cannon, R.J. Hijmans, T. Piessens, L.G. Saw, P.C. van Welzen & J.W.F. Slik-(2014)- Historical distribution of Sundaland's Dipterocarp rainforests at Quaternary glacial maxima. Proc. National Academy of Sciences USA (PNAS) 111, 47, p. 16790-16795.
(online at: https://www.pnas.org/doi/pdf/10.1073/pnas.1403053111)
(On extent of Dipterocarp rainforests on emergent Sundaland in SE Asia during Quaternary glaciations. Dipterocarp trees dominate rainforests of Sundaland, and their distributions serve as proxy for rainforest extent. Climate of C Sundaland during Last Glacial Maximum (LGM) suitable to sustain Dipterocarp rainforest, and presence of previously suggested transequatorial savannah corridor at that time unlikely)

Verstappen, H.Th. (1975)- On palaeoclimates and landform development in Malesia. In: G.J. Bartstra & W.A. Casparie (eds.) Modern Quaternary Research in Southeast Asia, A.A. Balkema, Rotterdam, 1, p. 3-35.
(Climate changes in Quaternary lead to alternating humid and more arid periods, also in tropics. Chemical weathering dominates in interglacial equatorial rainforest conditions, like in Holocene. During glacial periods more pronounced seasonality and physical desintegration of rocks becomes more important. Pleistocene lowered sea level probably did not cause incision of valleys on shelf as rivers have very low gradient. Etc.)

Verstappen, H.Th. (1980)- Quaternary climatic changes and natural environment in SE Asia. Geo Journal 4, 1, p. 45-54.

(Lower rainfall and longer dry season characterised SE Asia during Quaternary Glacials. This had important effect on vegetation and landform development. Low Glacial sea levels thought not to have caused river incision; deposition of coarse-textured materials more characteristic. Incision mainly tied to Interglacial and Holocene humic tropical conditions when vegetation interfered with non-concentrated surface wash)

Verstappen, H.Th. (1993)- Geomorphologie volcanique et attenuation des desastres naturels. Les volcans de l'Indonesie, quelques exemples. Bull. Association de Geographes Francais 70, 4, p. 367-376.

(online at: http://i-lib.ugm.ac.id/jurnal/detail.php?dataId=8432)
(Indonesian volcanic landforms: strato volcanoes, calderas and 'volcano-tectonic' depressions' associated with ignimbrite/ welded tuff plateaus (associated with deep-seated faults). Important role for geomorphological survey and use of aerospace technology in volcanic hazard zoning)

Verstappen, H.Th. (1998)- The effect of climatic change on Southeast Asian geomorphology. J. Quaternary Science 12, 5, p. 413-418.
(Quaternary climatic changes in SE Asia four types of fluctuations: temperature, precipitation, wind patterns and sea-level)

Verstappen, H.Th. (2000)- Outline of the geomorphology of Indonesia. lnt. Institute Aerospace Survey and Earth Sciences (ITC), Enschede, Publication 79, p. 1-212.
(Review of geomorphology research in Indonesia, including geologic framework, climatic factors affecting landforms, volcanic landforms, karst terranes, lowlands, coastal geomorphology and coral reefs)

Walsh, J.P. & C.A. Nittrouer (2003)- Contrasting styles of off-shelf sediment accumulation in New Guinea. Marine Geology 196, 3-4, p. 105-125.
(Study of modern 'highstand' off-shelf sedimentation in PNG Gulf of Papua and Sepik margin. Gulf of Papua receives >3x10-8 tons of sediment annually from rivers. Most accumulates on shelf, <5% deposited in Pandora Trough. Sepik margin different: Sepik River discharges ~1x10 -8 tons of sediment annually, and submarine canyon extends to river mouth. 90% of river material regularly produces gravity-driven flows in canyon)

Walsh, J.P. & C.A. Nittrouer (2004)- Mangrove-bank sedimentation in a mesotidal environment with large sediment supply, Gulf of Papua. Marine Geology 208, p. 225-248.
(Extensive mangrove forests are associated with major river systems. Indo-Pacific region numerous large rivers that discharge onto broad continental shelves, with common mangroves along these coastlines. Gulf of Papua >3350 km^2 of mangrove forests, majority associated with Fly, Kikori and Purari River deltas. Sediment trapping in W Gulf of Papua mangroves estimated to be 2-14% of total sediment load)

Walsh, J.P., C.A. Nittrouer, C.M. Palinkas, A.S. Ogston, R.W. Sternberg & G.J. Brunskill (2004)- Clinoform mechanics in the Gulf of Papua, New Guinea. Continental Shelf Research 24, 19, p. 2487-2510.
(Largest islands of Indo-Pacific Archipelago account for 20-25% of global sediment discharge to oceans, >50% of this supplied to wide (>150 km) continental shelves. These conditions create large-scale clinoforms-sigmoidal-shaped deposits on continental shelf. ~20% of sediment supplied to Gulf of Papua accumulates on clinoforms, <5% escapes to adjacent slope, 75% trapped on inner-topset region (<20 m depth) and within flood/ delta plains)

Webster, P.J.& N.A. Streten (1978)- Late Quaternary ice age climates of tropical Australasia: interpretations and reconstructions. Quaternary Research 10, 3, p. 279-309.

Weiss, T.L., B.K. Linsley, A.Gordon, Y. Rosenthal & S. Dannenmann-Di Palma (2022)- Constraints on Marine Isotope Stage 3 and 5 sea level from the flooding history of the Karimata Strait in Indonesia. Paleoceanography and Paleoclimatology (AGU) 37, 9, e2021PA004361, p.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/full/10.1029/2021PA004361)
(Reconstructtion of Pleistocene sea level fluctuations in Karimata Strait (between SW Kalimantan and Belitung islands) Karimata Strait (36m deep) likely closed/exposed during Marine Isotope Stage 3 (MIS 3; 60-26 ka)), which may have aided human migration to Borneo (Global mean sea level was lower than ca -22m). Karimata Strait was inundated during MIS 5a and 5c (117-72 ka), and GMSL was above −12 ± 7 m relative to today. Etc.)

Whiffin, T. (2002)- Plant biogeography of the SE Asian-Australian region. In: P. Kershaw et al. (eds.) Bridging Wallace's Line: the environmental and cultural history and dynamics of the SE Asian- Australian region, Advances in Geology 34, Catena Verlag, p. 61-82.

(Introduction and overview of special issue of Sedimentary Geology)

Woodroffe, C.D. (2000)- Deltaic and estuarine environments and their Late Quaternary dynamics on the Sunda and Sahul shelves. J. Asian Earth Sciences 18, 4, p. 393-413.
(online at: https://eurekamag.com/pdf/003/003399322.pdf)
(Deltaic and estuarine environments of Sunda shelf receive large volumes of sediment and had diverse and productive vegetation before clearing. Three periods of change: long-term response of deltaic- estuarine plains to postglacial sea-level rise, Holocene patterns of coastal progradation and distributary migration under relatively stable sea level and impact of human modifications)

Woodroffe, C.D. (2005)- Southeast Asian deltas. In: A. Gupta (ed.) The physical geography of Southeast Asia, Oxford University Press, p. 219-236.
(Brief review of delta processes and deltas of Irrawaddy, Mekong, Mahakam, Rajang-Barang, etc.in SE Asia)

Woodruff, D.S. (2010)- Biogeography and conservation in Southeast Asia: How 2.7 million years of repeated environmental fluctuations affect today's patterns and the future of the remaining refugial-phase biodiversity. Biodiversity and Conservation 19, p. 919-941.

(SE Asia geography today typical of only 2% of last million years; 90% of time land area was 1.5-2.0x larger as mean sea levels were 62m lower, climates were cooler, and extensive forests and savanna covered emerged Sunda plains. Land areas varied as sea levels fluctuated up to 50m with each of ~50 Pleistocene glacial cycles, and forests expanded and contracted with oscillations in land area and seasonality)

Woodson, A.L., E. Leorri, S.J. Culver, D. J. Mallinson, P.R. Parham, R.C. Thunell, V.R. Vijayan & S. Curtis (2017)- Sea-surface temperatures for the last 7200 years from the eastern Sunda Shelf, South China Sea: climatic inferences from planktonic foraminiferal Mg/Ca ratios. Quaternary Science Reviews 165, p. 13-24.
(online at: www.academia.edu/32712738/Sea_surface_temperatures_for_the_last_7200_years_from_t Etc.)
(Holocene temperature records in two cores from Holocene incised valley fills on Sunda Shelf off Sarawak. Several significant shifts between warmer and colder conditions. Coldest period analyzed at 5500-4500 cal., concomitant with wet period in Borneo. Last ~1000 years recorded warmest SST. Warm interval from ~1000-500 cal years BP may represent Medieval Climate Anomaly)

Wurster, C.M., M.I. Bird, I.D. Bull, F. Creed, C. Bryant, J.A.J. Dungait & V. Paze (2010)- Forest contraction in north equatorial Southeast Asia during the Last Glacial Period. Proc. National Academy of Sciences USA (PNAS), 107, 35, p. 15508-15511.
(online at: www.pnas.org/content/early/2010/07/22/1005507107.full.pdf)
(Distribution of vegetation in SE Asia during Last Glacial Maximum (23-19 ka) still debated. $d^{13}C$ carbon isotope composition of ancient cave guano profiles suggest substantial forest contraction during Last Glacial Period on Peninsular Malaysia (Batu cave) and Palawan (Gangub and Makangit caves), while rainforest was maintained in N Borneo (Niah cave). Results support rainforest 'refugia' hypotheses and provide evidence that environmental barriers reduced mixing between Borneo and Sumatra flora/ fauna. Also sheds light on possible early human dispersal events

Wurster, C.M., H. Rifai, B. Zhou, J. Haig. & M.I. Bird (2019)- Savanna in equatorial Borneo during the Late Pleistocene. Nature Scientific Reports 9, 6392, p. 1-7.
(online at: https://www.nature.com/articles/s41598-019-42670-4)
(The now-drowned Sundaland continent was exposed as contiguous landmass for most of past 2 million years. Stable carbon isotope composition (δ13C) of bat guano and High Molecular Weight n-alkanes from Saleh Cave in S Kalimantan demonstrates open vegetation existed during of much past 40,000 yrs BP (at S equatorial end of hypothesized 'savanna corridor'). Saleh Cave record also shows strong correspondence with insolation and sea surface T of Indo-Pacific Warm Pool, suggesting sensitivity of vegetation to tropical climate change on glacial/interglacial timeframes)

Wust, R.A.J. & R.M. Bustin (2004)- Late Pleistocene and Holocene development of the interior peat-accumulating basin of Tasek Bera, Peninsular Malaysia. Palaeogeogr. Palaeoclim. Palaeoecology. 211, 3-4, p. 241-270.
(Tasek Bera freshwater swamp is lowland dendritic basin in Peninsular Malaysia. Accumulation of organic matter in local lakes during Last Glacial Maximum, but widespread peat deposition did not start until 5300 BP when climatic changes led to evolution of wetland system. Peat accumulation progressively expanded with terrestrialisation of channels and subbasins to paludification of riparian part of lowland forest zone. Etc.).

Yudhicara, A. Ibrahim, V. Asvaliantina, W. Kongko & W. Pranowo (2012)- Sedimentological properties of the 2010 Mentawai tsunami deposit. Bulletin of the Marine Geology 27, 2, p. 55-65.
(online at: http://ejournal.mgi.esdm.go.id/index.php/bomg/article/view/45/46)
(Thickness of 2010 Mentawai tsunami deposits on Sipora and Pagai islands off W Sumatra 1.5-22 cm. Generally composed of fine-coarse sand, in irregular contact with underlying soil. Commonly multiple layers: run up at bottom and back wash at top. Fining upward, parallel lamination and soil clasts observed. Fossils generally rare, but include shallow marine foraminifera and abundant sponge spicules)

Yudhicara, Y. Zaim, Y. Rizal, Aswan, R. Triyono, U. Setiyono & D. Hartanto (2013)- Characteristics of paleotsunami sediments, a case study in Cilacap and Pangandaran coastal areas, Jawa, Indonesia. Indonesian Journal of Geology 8, 4, p. 163-175.

(online at: www.neliti.com/publications/68850/characteristics-of-paleotsunami-sediments-a-case-study-in-cilacap-and-pangandara)
(In Pangandaran, S Java, two possible tsunami deposits on top of soil horizons: 5-6 cm layer of coarse sand at top as 2006 tsunami deposit and 5-10 cm sand layer at bottom as paleotsunami. Sands contain (Miocene?) planktonic and shallow marine foraminifera)

(On upwelling events in S Makassar Strait during SE Monsoon period, associated with low sea surface temperature and high chlorophyll-a concentrations in seawater. Upwelling controlled by SE monsoon winds and enhanced by Indonesian Throughflow TF Makassar jet that creates large circular eddies flow due to complex topography in triangle area of S Makassar- E Java Sea- W Flores Sea)

Auer, G., D. de Vleeschouwer, R.A. Smith, K. Bogus, J. Groeneveld, P. Grunert, I.S. Castaneda, B. Petrick et al. (2019)- Timing and pacing of Indonesian Throughflow restriction and its connection to Late Pliocene climate shifts. Paleoceanography and Paleoclimatology (AGU) 34, 4, p. 635-657.
(online at: https://agupubs.onlinelibrary.wiley.com/doi/epdf/10.1029/2018PA003512)
(Pliocene characterized by gradual shift of global climate toward cooler and more arid conditions. Progressive restriction of Indonesian Throughflow (ITF) may have enhanced this shift toward stronger meridional thermal gradients. Reduced ITF, caused by N-ward movement of Australia and uplift of Indonesia, impeded global thermohaline circulation. Calcareous nannofossil record between 3.6- 3.0 Ma from IODP site U1463 suggests tropical Pacific ITF sources replaced by cooler, fresher N Pacific waters)

Ayers, J.M., P.G. Strutton, V.J. Coles, R.R. Hood & R.J. Matear (2014)- Indonesian throughflow nutrient fluxes and their potential impact on Indian Ocean productivity. Geophysical Research Letters 41, 14, p. 5060-5067.
(ODP Site U1463 provides record of local surface water conditions and Australian climate in relation to changing ITF connectivity. ITF configuration culminated ~3.54 Ma. Decrease in warm, oligotrophic taxa with shift from Gephyrocapsa to Reticulofenestra and increase of mesotrophic taxa suggest tropical Pacific ITF sources replaced by cooler, fresher, N Pacific waters. After 3.3 Ma restructured ITF established conditions for inception of Sahul-Indian Ocean Bjerknes mechanism and increased response to glacio-eustatic variability)

Barmawidjaja, D.M., E.J. Rohling, W.A. van der Kaars, C. Vergnaud Grazzini & W.J. Zachariasse (1993)- Glacial conditions in the northern Molucca Sea region (Indonesia). Palaeogeogr. Palaeoclim. Palaeoecology 101, p. 147-167.
(Core K12 from 3510m water depth N of N Halmahera spans last 27,000 yrs. Palynology suggests glacial time climate drier than today. This and lower sea level resulted in expansion of Lower Montane oak forests on Halmahera. Surface water salinities probably higher. Also well-developed 'Deep Chlorophyll Maximum layer'. With elevated planktonic forams Neogloboquadrina dutertrei and presence of Ng. pachyderma in glacial times (similar to observed in Sulu Sea by Linsley et al. 1985))

Barmawidjaja, D.M., A.F.M de Jong, K. van der Borg, W.A. van der Kaars & W.J. Zachariasse (1989)- Kau Bay, Halmahera, a late Quaternary palaeoenvironmental record of a poorly ventilated basin. In: J.E. van Hinte et al. (eds.) Snellius-II Symposium, Jakarta 1987, Netherlands J. of Sea Research 24, 4, p. 591-605.

Barmawidjaja, D.M., A.F.M de Jong, K. van der Borg, W.A. van der Kaars, W.J.M. van der Linden & W.J. Zachariasse (1989)- The timing of postglacial marine invasion of Kau Bay, Halmahera, Indonesia. Radiocarbon 31, 3, p. 948-956.
(Kau Bay, Halmahera, E Indonesia is small 470m deep marine basin, separated from SW Pacific Ocean by 40m deep shallow sill. Bay water below depth of ~350m devoid of oxygen and high dissolved H2S. Radiocarbon dating on piston cores and study on microfossils demonstrate Kau Bay was freshwater lake in Weichselian times (freshwater diatoms). At 10,000 BP reconnected with open ocean. If sill depth did not change in intervening years, sea level at 10,000 BP stood 40m below present level)

Barrows, T.T. & S. Juggins (2004)- Sea-surface temperatures around the Australian margin and Indian Ocean during the Last Glacial Maximum. Quaternary Science Reviews 24, p. 1017-1047.
(Sea-surface temperature maps for oceans around Australia based on planktonic foraminifera assemblages. During Last Glacial Maximum cooling in tropics of up to 4 °C in E Indian Ocean, mostly between 0- 3 °C elsewhere along equator. High latitudes cooled more, with maximum of 7-9 °C in SW Pacific Ocean)

Baumgart, A., T. Jennerjahn, M. Mohtadi & D. Hebbeln (2010)- Distribution and burial of organic carbon in sediments from the Indian Ocean upwelling region off Java and Sumatra, Indonesia. Deep Sea Research I, 57, 3, p. 458-467.
(On marine organic carbon productivity and preservation in Indian Ocean off Sumatra- Java- Banda Islands. Maximum concentrations of organic carbon (3.0%) and nitrogen (0.31%) in N Mentawai and Savu and Lombok basins. High productivity related to seasonal upwelling in Indian Ocean S of Java-Sumatra between June-November responsible for high carbon accumulation S of E Java- Lombok and in Savu Basin. Better preservation by reduced ventilation contributes to high carbon in N Mentawai)

Gordon, A.L., R.D. Susanto & K. Vranes (2003)- Cool Indonesian throughflow as a consequence of restricted surface layer flow. Nature 425, p. 824-828.
(online at: https://www.atmos.umd.edu/~dwi/papers/gordon_dwi_nature03.pdf)
Within Makassar Strait (primary pathway of Indonesian throughflow), flow far cooler than estimated earlier. During boreal winter monsoon, wind drives buoyant, low-salinity Java Sea surface water into S Makassar Strait, creating N-ward pressure gradient in surface layer of strait. This surface 'freshwater plug' inhibits warm surface water from Pacific Ocean from flowing S into Indian Ocean, leading to cooler Indian Ocean sea surface, which may weaken Asian monsoon. Summer wind reversal eliminates obstructing pressure gradient, by transferring more-saline Banda Sea surface water into S Makassar Strait)

Gourlan, A.T., L. Meynadier & C.J. Allegre (2008)- Tectonically driven changes in the Indian Ocean circulation over the last 25 Ma: Neodymium isotope evidence. Earth Planetary Science Letters 267, p. 353-364.
(Nd isotopic composition of Indian and Pacific Ocean cores for past 25 Ma reflect paleo-oceanography. Prior to 14 Ma broad passage between Indian and Pacific Oceans. Progressive closure of Indonesian gateway due to N movement of Australia and S-ward motion of Sunda block induced reorganization of paleoceanic circulation at ~14 Ma. Further reduced flux of Pacific water into Indian Ocean between 4- 2.5 Ma caused by final closure of Indonesian Gateway)

Hallberg, P.L., F. Schenk, K.A. Yamoah, X. Kuang & R.H. Smittenberg (2022)- Seasonal aridity in the Indo-Pacific Warm Pool during the Late Glacial driven by El Nino-like conditions. Climate of the Past 18, 7, p. 1655-1674.
(online at: https://cp.copernicus.org/articles/18/1655/2022/)
(Island SE Asia today is part of Indo-Pacific Warm Pool, an everwet humid region with world's largest tropical peat deposits. Most of this peat accumulated only recently, during Holocene, suggesting climate was drier and/or more seasonal during earlier times. During Last Glacial Maximum (LGM, 21 ka BP) colder, drier climate, with higher seasonality and likely expansion of savanna (and no peat). Late Glacial (14.7-11.7 ka BP) climate in Indonesian region transitional cool/dry/seosonal period before onset of warm Holocene (11.7- 0 ka))

Karas, C., D. Nurnberg, A.K. Gupta, R. Tiedemann, K. Mohan & T. Bickert (2009)- Mid-Pliocene climate change amplified by a switch in Indonesian subsurface throughflow. Nature Geoscience 2, June 2009, p. 434-438.
(Partial closing of Indonesian Gateway between 4-3 Ma supposedly triggered switch in source of waters feeding Indonesian Throughflow into Indian Ocean from warm- salty S Pacific water to cool and relatively fresh N Pacific Ocean waters. Planktonic foraminifera suggest surface conditions in E tropical Indian Ocean rel. stable from 5.5- 2 Ma, but subsurface waters freshened and cooled by about 4°C between 3.5- 2.95 Ma. Restriction of Indonesian Gateway led to cooling and shoaling of thermocline in tropical Indian Ocean)

Karas, C., D. Nurnberg, R. Tiedemann & D. Garbe-Schonberg (2011)- Pliocene Indonesian Throughflow and Leeuwin Current dynamics: implications for Indian Ocean polar heat flux. Paleoceanography 26, PA2217, p. 1-9.
(Planktonic foraminifera reflect Pliocene hydrography of W tropical Indian Ocean (Site 709C) and Leeuwin Current in E subtropical Indian Ocean (Site 763A) in response to Indonesian Gateway dynamics. Indonesian Throughflow and warm S-flowing Leeuwin Current off W Australia are essential for polar heat transport in Indian Ocean. During 3.5-3 Ma, sea surface T Leeuwin Current area 2-3°C cooler than rather unchanged sea surface T from tropical Indian Ocean, probably induced by tectonically reduced surface Throughflow)

Kawamura, H., A. Holbourn & W. Kuhnt (2006)- Climate variability and land-ocean interactions in the Indo-Pacific Warm Pool: a 460-ka palynological and organic geochemical record from the Timor Sea. Marine Micropaleontology 59, 1, p. 1-14.
(Climatic conditions in W Timor Sea and adjacent NW Australia reconstructed for last 460 ka from IMAGES Core MD01-2378. Reduced precipitation and elevated productivity characterize glacial stages. Long-term reduction in precipitation over last 320 ka in two steps at ~300 ka and 180 ka BP. Paleoproductivity and paleoclimate appear to be related to precession-controlled Australian monsoon system)

(Climate model to test response of climate to E-M-Pliocene tectonic changes, which constricted and uplifted passages between New Guinea and Sulawesi. Associated changes in Indonesian throughflow influenced amount of heat transported from Pacific to Indian Ocean and contributed to Pliocene climate change of Indo-Pacific)

Kuenen, P.H. (1939)- Sediments of the East Indian Archipelago. In: P.D. Trask (ed.) Recent marine sediments: a symposium, AAPG/ Society for Sedimentary Geology (SEPM), Tulsa, Special Publ. 4, p. 348-355.
(Sediments of Indonesian Archipelago vary greatly in different areas. In shallow Java Sea relatively fine-grained and rich in volcanic debris on S side near Java, relatively coarse-grained and quartz-rich on N side near Borneo.

Deep water sediments generally low in carbonate, mainly due to relatively high % terrigenous debris. Calcium carbonate decreases with depth from ~50% in water <500m deep to <5% for water >5000m deep. Sediments of Kau Bay contain H_2S and FeS; also rich in organic matter and black in color, suggesting condition of stagnation in this bay (500m deep and shallow connection with sea)

Zhang, P., R. Zuraida, J. Xu & C. Yang (2016)- Stable carbon and oxygen isotopes of four planktonic foraminiferal species from core-top sediments of the Indonesian Throughflow region and their significance. Acta Oceanologica Sinica 35, 10, p. 63-76.
(Horizontal and vertical distributions of δ18O and δ13C investigated in Globigerinoides ruber, Gs sacculifer, Pulleniatina obliquiloculata and Neogloboquadrina dutertrei, from 62 core-top samples from Indonesian Throughflow region. In Makassar Strait depleted δ18O and δ13C linked to freshwater input. In Bali Sea depleted δ18O result of freshwater input, while depleted δ13C more likely due to Java-Sumatra upwelling. G. ruber and G. sacculifer calcify within mixed-layer, respectively at 0-50 m and 20-75 m water depth, and P. obliquiloculata and N. dutertrei within upper thermocline at 75-125 m water depth)

Zuvela-Aloise, M. (2005)- Modelling of the Indonesian Throughflow on glacial-interglacial time-scales. Doct. Thesis Christian-Albrechts Universitat Kiel, p. 1-185.
(online at: http://d-nb.info/980884292/34)
(Model used to simulate circulation through the Indonesian Gateways. Lowering of glacial sea level of 120m not sufficient to severely block flow within Makassar Strait as main passage of Throughflow. Reduction in sill depth and absence of low buoyancy surface waters due to exposure of shelf area led to intensification of surface flow within Makassar Strait)

X.3. SE Asia- Modern carbonate environments, Coral Reefs, Cenozoic carbonates

Papers in this chapter on coral reefs and Cenozoic carbonates are of a more general nature. Numerous additional papers on specific localities may found under the areas. It includes references to reefs and Cenozoic carbonates from 'Circum-Indonesia' (North Australia, PNG, SW Pacific, Philippines, South China Sea, etc.), which all share characteristics with examples from Indonesia.

Akbar, M., B. Vissapragada, A.H. Alghamdi, D. Allen, M. Herron et al. (2001)- A snapshot of carbonate reservoir evaluation. Oilfield Review, Schlumberger, Winter 2000/2001, p. 20-41.
(online at: www.slb.com/~/media/Files/resources/oilfield_review/ors00/win00/p20_41.ashx)
(Reservoir evaluation paper with example of M Miocene buildup in Sibolga basin, off NW Sumatra, with unsuccessful 1997 well due to lack of internal seals and late top seal preventing capture of early biogenic gas)

Alcock, A. (1902)- Report on the deep-sea Madreporaria of the Siboga Expedition. Siboga Expeditie Monograph 16a, Brill, Leiden, p. 1-51.
(online at: www.archive.org/details/sibogaexpeditie07sibo)
(Descriptions of 75 species of modern, mainly solitary deep-sea corals from East Indonesia, collected during Siboga Expedition 1899-1900, incl. Caryophyllia, Dendrophyllia, Coenopsammia, etc)

Amir, S., H. Tsegab, G.J. Soto & A.I. Azman (2022)- Facies mapping of the Holocene carbonate complexes in Kepulauan Seribu Java Basin, Indonesia using satellite-derived data set. Pertanika J. Science Technology 30, 3, p. 2253-2270.
(online at: http://www.pertanika.upm.edu.my/resources/files/Pertanika%20PAPERS/JST%20Vol.%203 Etc.)
(Satellite image mapping of modern carbonate sub-environments in Thousand Islands patch reefs complex, Jakarta Bay/Java Sea: reef sand apron, subtidal reef margin, and shallower subtidal lagoon. Bidirectional monsoon winds caused E-W orientations of individual reefs. Islands in S part of complex include larger platforms, with lagoons less <3 m deep and larger reef sand aprons; N part of archipelago reefs smaller with no lagoon formation. Etc. (see also earlier 'classic' works on this modern reef complex by Scrutton (1976), Jordan (1998) and Park (1992, 2003), also Utami (2021), Jambak et al. (2022), etc.)

Ashton, P.R. (1981)- Estimating potential reserves in Southeast Asian Neogene reefs. Proceedings Seminar Assessment of undiscovered oil and gas, Kuala Lumpur 1980, UN ESCAP CCOP, Technical Publication 10, p. 244-259.

Azmy, K., E. Edinger, J. Lundberg & W. Diegor (2010)- Sea level and paleotemperature records from a mid-Holocene reef on the North coast of Java, Indonesia. Int. J. Earth Sciences (Geologische Rundschau) 99, p. 231-244.
(Mid-Holocene fossil fringing reefs at Point Teluk Awur, near Jepara, N coast of C Java, contains two horizons of Porites lobata microatolls. Age of corals in lower horizon, 80 cm above sea level, ~7000 yr BP, upper horizon at 1.5m, ~6960 ± 60 yr BP, matching transgressive phase of regional sea-level curves)

Bak, R.P.M. & G.D.E. Hovel (1989)- Ecological variables, including physiognomic structural attributes, and classification of Indonesian coral reefs. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 23, 2, p. 95-106.
(Measured transects across 30+ seaward facing modern coral reef slopes in E Indonesia (results not clear?))

Bal, A.A., R. Bray & R. Sigit (2012)- Hydrothermally enhanced fractured reservoirs- a new play? Petroleum Geoscience Conference Exhib. PCGE 2012, Kuala Lumpur 2012, p. 1-3. *(Extended Abstract)*
(online at: http://geology.um.edu.my/gsmpublic/PGCE2012/)
(With exception of Nang Nuan (Gulf of Thailand karst buried hill) and some references to fractured granites in Vietnam, hydrothermally altered hydrocarbon reservoirs largely unreported in SE Asia. Hydrothermal fluids may create higher porosities than expected, not necessarily associated with unconformities)

Bassi, D., J.H. Nebelsick, A. Checconi, J. Hohenegger & Y. Iryu (2009)- Present-day and fossil rhodolith pavements compared: their potential for analysing shallow-water carbonate deposits. Sedimentary Geology 214, p. 74-84.
(Review of rhodoliths (algal nodules consisting predominantly of coralline algae) and sediments formed by these unattached coralline algae, called rhodolith pavements. Includes study of Recent 'rhodolith pavement' off Sesoko-jima (S Japan), at depths of 50-70 m on submarine terrace)

Bernecker, M. (2005)- Late Triassic reefs from the Northwest and South Tethys: distribution, setting, and biotic composition. Facies 51, p. 442-453.
(Ladinian and Carnian increasing expansion of reefs. Optimum reef diversity and frequency in Norian, as sponge and coral reefs associated with development of carbonate platforms. Not much on SE Asia)

Betzler, C. (1997)- Ecological control on geometries of carbonate platforms: Miocene/Pliocene shallow-water microfaunas and carbonate biofacies from the Queensland Plateau (NE Australia). Facies 37, p. 147-166.
(Miocene and Pliocene of ODP Leg 133 sites record biofacies evolution prior and during the partial drowning of Queensland Plateau carbonate platform. M Miocene depositional geometry is carbonate bank with a well-defined rim and flank. Late Miocene- E Pliocene carbonate ramps, rich in large benthic forams. Reconstruction of Tortonian- Messinian relative sea level curve shows rise punctuated by four falls. Lepidocyclina (N.) rutteni described from Australian faunal province for first time)

Betzler, C., T.C. Brachert & D. Kroon (1995)- Role of climate for partial drowning of the Queensland Plateau carbonate platform (northeastern Australia). Marine Geology 123, p. 11-32.
(Late Miocene- E Pliocene partial drowning of Queensland Plateau carbonate platform off NE Australia. Modern plateau mosaic of pinnacle reefs and larger reefs representing relicts of E-M Miocene buildups. Late Miocene rich in larger forams Lepidocyclina and Cycloclypeus show Pliocene partial drowning of platform preceded by 4 Myr of neritic carbonate deposition without any reefs. Low surface water temperatures (17°-19°C) major factor which suppressed reef growth during Late Miocene- E Pliocene)

Betzler, C. & G.C.H. Chaproniere (1993)- Paleogene and Neogene larger foraminifers from the Queensland Plateau: biostratigraphy and environmental significance. In: J.A. McKenzie, P.J. Davies et al. (eds.) Proc. Ocean Drilling Program (ODP), Scientific Results 133, p. 51-66.
(Leg 133 Queensland Plateau ODP site sites with Eocene (Nummulites, Discocyclina) and Late Oligocene- M Miocene larger foram facies)

Boekschoten, G.J., M. Borel Best, A. Oosterbaan & F.M. Molenkamp (1989)- Past corals and Recent reefs in Indonesia. Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 23, 2, p. 117-122.
(Snellius-II Expedition collections of Lower Pliocene corals near Salayer and Quaternary reefs on Ambon and Sumba and compared with Pliocene of Nias. Absence of Acropora and Montipora from Quaternary coral faunae (common in Pliocene and modern reefs) may reflect disturbance by Pleistocene sea level fluctuations)

Boekschoten, G.J., M.B. Best & K.S. Putra (2000)- Balinese reefs in historical context. In: K.S.Moosa et al. (eds.) Proc. 9th International Coral Reef Symposium, Bali 2000, 1, p. 321-324.
(online at: www.reefbase.org/resource_center/publication/pub_14767.aspx)
(Oldest reefs of Bali developed on top of Neogene pillow lava flows, but barely preserved. Parts of early and late Pleistocene reefs on Bukit Peninsula in S Bali. Holocene post-glacial reefs developed along limestone cliffs and denuded volcanic hardnecks; on lava outflows; and on residual boulder coasts)

Boichard, R., P.F. Burollet, B. Lambert & J.M. Villain (1985)- La plate-forme carbonate du Pater Noster, Est de Kalimantan (Indonesie), etude sedimentologique et ecologique. TOTAL Compagnie Francaise du Petrole, Notes et Memoires 20, p. 3-101.

('The carbonate platform of Paternoster, East of Kalimantan'. Well-documented sedimentological- ecological study by TOTAL personnel of Recent sediments on marine platform bordering SW Makassar Straits deepwater and its coral reef islands. All bottom samples are m-c grained carbonate sands. On reef islands mainly fragments of corals, algae and foraminifera, between reef complexes mainly benthic foraminifera. In some sheltered lows abundant Halimeda algae. On E slope of platform common planktonic foraminifera, coccoliths and glauconite)

Borel Best, M. & G.S. Boekschoten (1989)- Comparative qualitative studies on coral species composition in various reef sites in the eastern Indonesian Archipelago. In: J.H. Choat et al. (eds.) Proc. 6th International Coral Reef Symposium, Townsville, 3, p. 197-204.
(350 species of living corals in E Indonesia)

Borel Best, M., B.W. Hoeksema, W. Moka, H. Moll, Suharsono & I. Nyoman Sutra & (1989)- Recent scleractinian coral species collected during the Snellius-II Expedition in Eastern Indonesia. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 23, 2, p. 107-115.
(East Indonesia has the richest coral reef faunas in the world (other rich areas are Philippines and Great Barrier Reef of NE Australia). During 1984 Snellius-II Expedition ~350 species/75 genera of scleractinian corals were collected from 9 coral reef areas between Sulawesi-Sumba-Seram. Most reefs differ greatly from one another)

Bosence, D. (2005)- A genetic classification of carbonate platforms based on their basinal and tectonic setting in the Cenozoic. Sedimentary Geology 175, p. 49-72.
(Eight types of carbonate platform recognized, based on basinal and tectonic setting: Fault-Block, Salt Diapir, Subsiding Margin, Offshore Bank, Volcanic Pedestal, Thrust-Top, Delta-Top and Foreland Margin platforms)

Bourrouilh-Le Jan, F.G. (1979)- Les plate-formes carbonatees de haute energie a rhodolithes et la crise climatique du passage Mio-Pliocene dans le domaine Pacifique. Bull. Centres Recherches Exploration-Production Elf-Aquitaine 3, 2, p. 489-495.
('The high energy carbonate platforms with rhodoliths and the climatic crisis of the Mio-Pliocene transition in the Pacific area'. Large Middle and Late Miocene carbonate platforms built on volcanic remains in W and SW Pacific. In rhodolith facies, without corals, probably related to colder climate interval (?). Warming around Mio-Pliocene boundary allowed resettlement of corals)

Bourrouilh-Le Jan, F.G. & L.C. Hottinger (1988)- Occurrence of rhodolites in the tropical Pacific- a consequence of Mid-Miocene paleo-oceanographic change. Sedimentary Geology 60, p. 355-358.
(Rhodolites over wide areas of tropical Pacific dated as M Miocene. They are preceded in E Miocene and succeeded in Late Miocene by hermatypic coral deposits. Possible causes of facies change: sea-level rise drowning reefs, drop of winter surface water temperature and increase in fertility of surface waters inhibiting compensatory growth of hermatypic corals until sea-level fall restored original conditions of deposition)

Braga, J.C. (2011)- Fossil coralline algae. In: D. Hopley (ed.) Encyclopedia of modern coral reefs; structure form and process, Springer Verlag, Dordrecht, p. 423-426.
(Depth zonation of coralline algae in Quaternary Pacific reefs three zones: (1) Shallow coral reef (0-5/20m): coralline algae encrusting corals (Hydrolithon, Neogoniolithon); (2) Intermediate fore-reef slope (15/20-50/60m): coralline algae as rhodoliths (Mesophyllum, Lithophyllum); (3) Deep fore-reef slope (50/60- 120m): coralline algae as nodules in carbonate sands or crusts on hard substrates, frequently intergrown with encrusting foraminifera (Lithothamnium, Mesophyllum, Sporolithon, Peyssonnellia))

Braithwaite, C.J.R. & L.F. Montaggione (2009)- The Great Barrier Reef: a 700 000 year diagenetic history. Sedimentology 56, p. 1591-1622.
(Variety of carbonate cements identified in deep borehoe through Ribbon Reef 5, off NE Australia)

Bromfield K. (2010)- Evolutionary dynamics of Indo-Pacific reef corals throughout the Neogene. Ph.D. Thesis, University of Queensland, p. 1-269. *(Unpublished)*
(Study of 155 species of M Miocene- E Pleistocene reef coral communities from Indonesia (Salayar, S Sulawesi), PNG (New Britain) and Fiji. Coral communities vary with global sea level and time. 41.8% of species in M

Miocene in New Britain now extinct. Study supports previously proposed models of E Pliocene turnover event in Scleractinia in Indo-Pacific)

Bromfield, K. & J.M. Pandolfi (2011)- Regional patterns of evolutionary turnover in Neogene coral reefs from the central Indo-West Pacific Ocean. Evolut. Ecology, May 2011, p. 1-17.
(Neogene origination and extinction patterns from Indonesia (Salayar Island; 5.8-1.4 Ma), New Britain and Fiji. Two faunal turnover events: (1) increase in Scleractinia diversity during M Miocene (17-14 Ma), coinciding with large-scale sea level fluctuations and M Miocene collision event, possibly facilitated by habitat fragmentation associated with tectonism and sea level fall (2) lowering of diversity throughout Late Miocene-Pliocene (7-3 Ma), followed by pulse of extinction at Pliocene-Pleistocene boundary (~2.6 Ma))

Brouwer, H.A. & G.A.F. Molengraaff (1919)- On reef caps. Proc. Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam, 21, 2, p. 816-826.
(Many islands in E Indonesia covered with Plio-Pleistocene fringing reefs, on some islands elevated recently up to 1300m above s.l. Highest reef caps are not necessarily oldest if uplift not uniform)

Brouwer, H.A. (1926)- The origin of coral reefs and reef caps with special reference to mountain building within the Netherlands East Indies. Proc. 2nd Pan-Pacific Science Congress, Australia, 1923, p. 1164-1167.

Brown, B.E. (2007)- Coral reefs of the Andaman Sea- An integrated perspective. In: R.N. Gibson et al. (eds.) Oceanography and Marine Biology: an annual review 45, CRC Press, p. 173-194.
(online at: https://www.researchgate.net/publication/279403911_Coral_reefs_of_the_Andaman_Sea_-_An_integrated_perspective)
(Review of the common and often diverse coral reefs in the Andaman Sea region. Fringing reefs abundant in Andaman and Nicobar Islands, Mergui Archipelago (Myanmar), west coasts of Thailand and Malaysia, and NW Sumatra. Most have never been visited by scientists)

Brownlee, D.N. & M.W. Longman (1981)- Depositional history of a Lower Miocene pinnacle reef, Nido B oilfield, the Philippines. Proc. 4th International Coral Reef Symposium, Manila, 1, p. 619-625.
(Lower Miocene pinnacle reef complexes at Nido fields in S China Sea, NW of Palawan. Relief ~150-200 m)

Davies, P.J. & D.W. Kinsey (1977)- Holocene reef growth- One Tree island, Great Barrier reef. Marine Geology 14, 1, p. M1-M11.
(Data from One Tree Reef, NE Australia, and other sources suggest post-glacial coral reefs in Great Barrier Reef probably date from only ~9,000 years ago, likely growing on elevated parts of irregular karst surface. Growth dominantly vertical because of rapid sea-level rise, with recent lateral growth mainly in leeward direction)

Davies, P.J. & J. Marshall (1985)- *Halimeda* bioherms-low energy reefs, northern Great Barrier Reef. In: M. Harmelin Vivien & B. Salvat (eds.) Proc. 5th International Coral Reef Symposium, Tahiti 1985, 5, p. 1-7.
(Holocene bioherms of accumulations of green alga Halimeda cover large areas of outer shelf in 30-50m depths in N Great Barrier Reef, behind shelf edge reefs (see also Marshall and Davies 1988))

Davies, P.J., P.A. Symonds, D.A. Feary & C.J. Pigram (1988)- Facies models in exploration- the carbonate platforms of North-East Australia. Australian Petroleum Exploration Assoc. (APEA) Journal 28, 1, p. 123-143.

Davies, P.J., P.A. Symonds, D.A. Feary & C.J. Pigram (1989)- The evolution of the carbonate platforms of Northeast Australia. In: P.D. Crevello et al. (eds.) Controls on carbonate platform and basin development, Society for Sedimentary Geology (SEPM) Special Publ. 44, p. 233-258.

(Carbonate platforms of NE Australia (Great Barrier Reef, Queensland, Marion and Eastern Plateaus S of PNG) contain record complex interactions over past 60 My. Size, shape, and location of carbonate platforms determined by continental rifting. N-ward plate movement controlled distribution of climate facies in Great Barrier Reef sequence. Rising and high sea-level periods favored increased carbonate deposition, falling low sea-levels restricted carbonate deposition. Oceanographic factors affected platform evolution, e.g., inhibition of reef development by high oceanic-phosphate levels during E-M Miocene. Development of foreland basin on N edge of NE Australian region initially caused dramatic expansion of carbonate facies, but ultimately terminated carbonate deposition as result of uplift and inundation by clastic detritus)

Davies, P.J., P.A. Symonds, D.A. Feary & C.J. Pigram (1989)- The evolution of the carbonate platforms of Northeast Australia. Geological Society Australia, Special Publ. 18, 1991, p. 44-78.

Droxler, A.W. & S.J. Jorry (2013)- Deglacial origin of barrier reefs along low-latitude mixed siliciclastic and carbonate continental shelf edges. Annual Review Marine Science 5, p. 165-190.
(Modern coral barrier reefs extend along edges of some low-latitude siliciclastic shelves for 10's-1000's of km (Great Barrier Reef, NE Australia). Onset of rapid sea-level rise during early deglaciations was opportune time for coralgal communities establishment on top of maximum lowstand siliciclastic coastal deposits (beach ridges, lowstand shelf-edge deltas). Most modern barrier reefs relatively thin (~120m), late-Quaternary deposits, dating from mid Brunhes (~400 ky?) to Recent, composed of 4-5 stacked coralgal units, separated by exposure horizons (reflecting 100,000-year glacial-interglacial cycles) and covering older nonreefal, often siliciclastic deposits. Includes examples from Gulf of Papua)

Eberli, G.P., F.S. Anselmetti, A.R. Isern & H. Delius (2010)- Timing of changes in sea-level and currents along Miocene platforms on the Marion Plateau. In: W.A. Morgan, A.D. George et al. (eds.) Cenozoic carbonate systems of Australasia, Soc. Sedimentary Geology (SEPM), Special Publ. 95, p. 219-242.
(N and S Marion Platforms off NE Australia studied by ODP 194 wells and seismic. Built by cool, subtropical faunal assemblages and asymmetric geometry. Four megasequences subdivided into 14 sequences. E-M Miocene sequences are prograding and aggrading sequences. From late M Miocene, mounded geometries in basinal area where large drift deposits accumulated. Two most prominent sequences boundaries are drowning unconformities, at 11.1 Ma (N) and ~7 Ma (S Marion Platform). Timing of many Neogene sequence boundaries coincides with boundaries on Queensland Plateau (ODP Leg 133) and along Bahamas Transect (ODP Leg 166), suggesting global synchroneity of Neogene 3rd order sea-level changes)

Edinger, E.N. (1998)- Effects of land-based pollution on Indonesian coral reefs; biodiversity, growth rates, bioerosion, and applications to the fossil record. Ph.D. Thesis, McMaster University. Hamilton, p. 1-297.
(Pollution damage measured in surveys of 8 Java Sea reefs and 8 reefs in Ambon and Sulawesi. Reefs subject to land-based pollution 30-60% less diverse at 3-10m depth. Polluted reefs dominated by massive and submassive corals, and have almost no Acropora corals. Unpolluted reefs dominated by Acropora at 3m and by branching or foliose corals at 10m)

Edinger, E.N., J. Kolasa & M.J. Risk (2000)- Biogeographic variation in coral species diversity on coral reefs in three regions of Indonesia. Diversity and Distribution 6, p. 113-127.
(Coral species diversity along transects from 14 reefs in Ambon S Sulawesi and Java Sea. Sites relatively unaffected by land-based pollution in E Indonesia 20% more diverse than Java Sea. Despite fact that Java Sea was exposed during Pleistocene lowstands, and was recolonized only within last 10 000 years, coral species diversity and assemblage composition on Java Sea reefs similar to open ocean reefs in E Indonesia)

Ehrenberg, S.N. (2004)- Porosity and permeability in Miocene carbonate platforms of the Marion Plateau, offshore NE Australia: relationships to stratigraphy, facies and dolomitization. In: C.J.R. Braithwaite et al. (eds.) The geometry and petrogenesis of dolomite hydrocarbon reservoirs, Geological Society, London, Special Publ. 235, p. 233-253.
(Analyses of porosity and permeability in two Miocene carbonate platforms cored by ODP Leg 194, seaward of Great Barrier Reef, at N Marion Platform mostly preserved as limestone) and S Marion Platform (mostly dolomitized))

Ehrenberg, S.N., G.P. Eberli & G. Baechle (2006)- Porosity-permeability relationships in Miocene carbonate platforms and slopes seaward of the Great Barrier Reef, Australia (ODP Leg 194, Marion Plateau). Sedimentology 53, p. 1289-1318.
(Porosity-permeability analyses of Early- Late Miocene platform and deep water carbonates cored on Marion Plateau. Platforms experienced widely varying calcite cementation, dolomitization and dissolution but little evidence of meteoric diagenesis, suggesting subaerial exposure played little role in porosity-permeability evolution. Permeability controlled by grain size and calcite cement content in grainstones and shelter pores and vugs in mud-rich samples. Dolomitization reduces permeability variation. 'Windward' (current-facing) settings overall higher permeability (less muddy depositional facies, greater cementation, and lesser grain dissolution))

Ehrenberg, S.N., J.M. McArthur & M.F. Thirlwall (2006)- Growth, demise and dolomitization of Miocene carbonate platforms on the Marion Plateau, Offshore NE Australia. Journal of Sedimentary Research 76, p. 91-116.
(Sr-isotope stratigraphy used to determine timing of depositional events and dolomitization in two Miocene carbonate platforms cored by ODP Leg 194, seaward of Great Barrier Reef. Initial transgression of Marion Plateau volcanic basement E Oligocene (29-31 Ma). Main growth of carbonate platforms in Miocene (23-7 Ma), with five depositional sequences. Both platform-demise events (10.7 and 6.9 Ma) coincide with falls in global sea level combined with decreasing water temperature)

Flamand, B., G. Cabioch, C. Payri & B. Pelletier (2008)- Nature and biological composition of the New Caledonian outer barrier reef slopes. Marine Geology 250, p. 157-179.
(Grande Terre island of New Caledonia enclosed by one of longest barrier reefs in world. Forereef slopes from 40- 320m depth with 7 sedimentary facies. From upper reef slopes to ~90m thick coralline algal crusts dominant. Three groups: (C), shallowest, mainly mastophorids (Hydrolithon, Lithoporella, Neogoniolithon) and Lithophyllum); (B) Lithophyllum spp, Mesophyllum and Peyssonnelia from 15-40m; (A) rich in Mesophyllum,

Peyssonnelia, Sporolithon on deep reef slopes up to 90m. Below ~90m encrusting foraminifera acervulinids progressively replace coralline algal crusts)

Flugel, E. (1988)- *Halimeda*: paleontological record and palaeoenvironmental significance. Coral Reefs 6, p. 123-130.
(Halimediform algae in carbonate rocks since U Triassic. Some 30 species described, in four 'genera'. Recent Halimeda in lagoonal and reefal environments. Reinvestigation of Boueina limestones from Norian-Rhaetian lagoonal carbonates of W Thailand indicates important role of alga (up to 60% Boueina marondei n. sp.) in sediment accumulation since Late Triassic)

Flugel, E. (1982)- Evolution of Triassic reefs: current concepts and problems. Facies 6, p. 297-327.
(Norian and Rhaetian reefs known from many parts of the Tethys, incl. Seram, Timor in E Indonesia)

Flugel, E. (2002)- Triassic reef patterns. In: W. Kiessling et al. (eds.) Phanerozoic reef patterns, Soc. Sedimentary Geology (SEPM) Special Publ. 72, p. 391-463.
(Includes summaries of known Triassic reefal carbonates in Timor (various localities with Norian reef sponges and corals), Sulawesi, C-E Seram (up to 150m thick sponge-coral-hydrozoan limestone; Wilckens 1937), Papua New Guinea. (Triassic limestone development in Indonesia appears to follow trends across Tethys: first reef optimum in earliest Carnian (sponge-dominated), decrease in LateCarnian, second reef optimum in Late Norian-Rhaetian (sponge-coral and coral dominated); JTvG)

Flugel, E. & B. Senowbari-Daryan (2001)- Triassic reefs of the Tethys. In: G.D. Stanley (ed.) The history and sedimentology of ancient reef systems, Topics in Geobiology, Kluwer, New York, 17, p. 217-249.
(Evolution of Triassic reefs started with ~12 Myr global crisis of metazoan reef ecosystem after Permian-Triassic mass extinction), followed by recovery during M Triassic. Reef systems differentiated during U Triassic but were severely affected by global crisis at Triassic-Jurassic boundary)

Friedman, G.M. (1983)- Reefs and porosity: examples from the Indonesian Archipelago. Proc. SE Asia Petroleum Exploration Society (SEAPEX) 6, p. 35-40.
(Most porosity in Tertiary reefal carbonates in Indonesia involves post-depositional diagenetic changes)

Friedman, G.M. (1988)- Case histories of coexisting reefs and terrigenous sediments: the Gulf of Eilat (Red Sea), Java Sea, and Neogene basin of the Negev, Israel. In: L.J. Royle & H.H. Roberts (eds.) Carbonate clastic transitions, Elsevier Developments in Sedimentology 42, p. 77-97.

Fulthorpe, C.S. & S.O. Schlanger (1989)- Paleo-oceanographic and tectonic settings of Early Miocene reefs and associated carbonates of offshore Southeast Asia. American Assoc. Petroleum Geol. (AAPG) Bull. 73, 6, p. 729-756.
(Late Oligocene- early M Miocene widespread carbonates/reefs in SE Asia, related to rising eustatic sea level and expansion of coral-algal facies belt N to Japan and S to New Zealand. Examples mainly from Philippines)

Gallagher, S.J., L. Reuning, T. Himmler, J. Henderiks, D. De Vleeschouwer, J. Groeneveld, A. Rastigar Lari et al. (2018)- The enigma of rare Quaternary oolites in the Indian and Pacific Oceans: A result of global oceanographic physicochemical conditions or a sampling bias? Quaternary Science Reviews 200, p. 114-122.
(The Indo-Pacific area stands out as region without modern marine oolites, especially during Quaternary (the "ooid enigma"). Recent coring by IODP 356 off W Australia shows common ooid horizons in Pleistocene up to 730,000 years old. Increased aridity associated with higher alkalinity conditions during glacials probably facilitated ooid precipitation on tropical carbonate platforms particularly offshore arid Australia)

Gallagher, S.J., M.W. Wallace, P.W. Hoiles & J.M. Southwood (2014)- Seismic and stratigraphic evidence for reef expansion and onset of aridity on the North West Shelf of Australia during the Pleistocene. Marine and Petroleum Geology 57, p. 470-481.

(Previously unknown series of drowned fossil reefs in NW Australia shelf described. Reefs formed around 0.5 Ma with oldest ooids in Indian Ocean. Reef expansion partly due to increased Leeuwin Current intensity. Tropical facies expanded with onset of aridification of Australia after 0.6 Ma)

Gerth, H. (1925)- Die Bedeutung der Tertiaeren Riffkorallenfauna des malaysischen Archipels fur die Entwicklung der lebenden Rifffauna im Indopazifischen und Atlantischen Gebiet. Verhandelingen Geologisch-Mijnbouwkundig Genootschap Nederland Kolonien, Geologische Serie 8 (Gedenkboek Verbeek, memorial volume), p. 173-196.

Halfar, J. & M. Mutti (2005)- Global dominance of coralline red-algal facies: a response to Miocene oceanographic events. Geology (GSA) 33. 6, p. 481-484.
(Global rhodalgal facies peak abundances in Burdigalian-E Tortonian (16-11 Ma). Dominance of red algae over coral reefs triggered by Burdigalian global increase in productivity (higher C- isotope values). Rhodalgal lithofacies expanded further in M Miocene when strengthened thermal gradients associated with establishment of E Antarctic Ice Sheet led to enhanced upwelling, while increased weathering rates introduced land-derived nutrients into oceans. Cooler temperatures following E-M Miocene climatic optimum contributed to sustain dominance of red algae)

Hallock, P. & L. Pomar (2008)- Cenozoic photic reef and carbonate ramp habitats: a new look using paleoceanographic evidence. Proc. 11th International Coral Reef Symposium, Fort Lauderdale 2008, p. 1-5.

Hallock, P. & L. Pomar (2012)- Cenozoic evolution of carbonate shelf and ramp habitats: insights from paleoceanography. AAPG Annual Convention Exhib., Long Beach 2012, Search and Discovery Article 50663, p. 1-42. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2012/50663hallock/ndx_hallock.pdf)
(On relationships between carbonate deposition and Greenhouse vs Icehouse conditions. Large Benthic Forams assemblages most diverse when deeper waters were warmest, with high extinction rates during cooling (increase of surface to thermocline gradients). Aragonite production by corals more widespread during ice-house conditions)

Hantoro, W.S. (1994)- Batugamping terumbu koral Kwarter terangkat di Timor. Proc. 23rd Annual Conv. Indonesian Association Geologists (IAGI), Jakarta, 1, p. 192-207.
(online at: https://www.iagi.or.id/web/digital/62/18.pdf)
('Uplifted Quaternary coral reef limestones of Timor'. Uplifted marine coral reef limestone terraces across much of Timor, up to 1200m a.s.l. Unconformable on older rocks. In Kupang area 8 Late Pleistocene terraces up to ~120m elevation, suggesting uplift rate of W tip of Timor 0.35-0.45 mm/yr)

Hantoro, W.S., N. Nganro, S. Shofiyah, I. Narulita & J. Sofjan (1997)- Recent climate variation signals from corals in Timor, Indonesia. Quaternary International 37, p. 81-87.

Harrison, G.W.M., N. Santodomingo, K.G. Johnson & W. Renema (2023)- Is the Coral Triangle's future shown in a Pliocene reef gap? Coral Reefs 42, p. 1219-1225.
(online at: https://link.springer.com/article/10.1007/s00338-023-02412-5)
(Distributions of coral reefs in center of maximum coral diversity (Coral Triangle= Indonesian Archipelago-Philippines- New Guinea) show significantly fewer coral reefs during Pliocene ('Pliocene Reef Gap'). Reefs re-established in Pleistocene. Reefs decrease not associated with drop in coral genus diversity or warming or increasing pCO2 or human factors. Regional tectonics and sea-level rise possible drivers)

Haryono, E., S.T.J. Putro, D.H. Barianto, M.H.D. Sasongko & J.B. Setiawan (2022)- The formation of an open atoll in strike slip-fault setting: new insight from Maratua Island, Kalimantan-Indonesia. Environmental Earth Sciences 81, 350, p.
(Maratua Island V-shaped open atoll off NE Kalimantan, mainly controlled by sinistral fault system. Island is push-up morphology which formed a carbonate high (Pliocene transpression).

(Reefs across S China Sea with 571 known species of reef corals)

Iryu, Y. (1997)- Pleistocene fore-reef rhodoliths from the Ryukyu Islands, southwestern Japan. In: H.A. Lessios and I.G. Macintyre (eds.) Proc. 8th International Coral Reef Symposium, Panama, 1, p. 749-754.
(Well-rounded rhodoliths 1-8 cm consist of multiple species of nongeliculatecoralline algae and encrusting foraminifer Acervulina inhaerens, together forming concentric internal structure. Thought to have formed in deep fore reef to shelf, at 50-150m depth. Often associated with Cycloclypeus- Operculina foram assemblage)

Iryu, Y., S. Inagaki, Y. Suzuki & K. Yamamoto (2010)- Late Oligocene to Miocene reef formation on Kita-daito-jima, northern Philippine Sea. In: M. Mutti et al. (eds.) Carbonate systems during the Oligocene-Miocene climatic transition, Int. Association of Sedimentologists (IAS), Special Publ. 42, p. 245-256.
(Late Oligocene- Late Miocene carbonate in 433m deep borehole on Kita-daito-jima)

Iryu, Y. & S. Matsuda (1988)- Depth distribution. abundance and species assemblages of nonarticulated coralline algae in the Ryukyu Islands, southwestern Japan. In: J.H. Choat et al. (eds.) Proc. 6th International Coral Reef Symposium, Townsville 1988, 3, p. 101-106.
(Distribution of 8 non-articulated coralline algal species in upper 30m of slope of patch reef off Yonehara, Ishigaki-jima: Porolithon onkodes and Lithophyllum insipidum most abundant at depth of 1m, but absent below 20m. Spongites sp. A most common at 15m depth. Neogoniolithon conicum distributed throughout)

Iryu, Y., T. Nakamori, S. Matsuda & O. Abe (1995)- Distribution of marine organisms and its geological significance in the modern reef complex of the Ryukyu Islands. Sedimentary Geology 99, p. 243-258.

(Compositions of coral and coralline algal assemblages change with increasing depth. Hermatypic corals common down to 50m. Coralline algae Hydrolithon onkodes limited to upper 10m. Algal nodules with encrusting foram Acervulina inhaerens (rhodoliths) most abundant constituent on island shelf, commonly with Cycloclypeus carpenteri (50-150m). In Ryukus negligible Halimeda; probably two types of shelves in tropical- subtropical regions: nutrient-rich Halimeda-dominant and nutrient-poor rhodolith-dominant)

Iryu, Y., T. Nakamori & T. Yamada (1998)- Pleistocene reef complex deposits in the Central Ryukus, south-western Japan. In: G.F. Camoin & P.J. Davies (eds.) Reefs and carbonate platforms in the Pacific and Indian Oceans, Int. Association of Sedimentologists (IAS), Special Publ. 25, p. 197-213.
(Pleistocene carbonates of Ryuku Group with extensive rhodoliths in distal parts of reef complex. Four facies: (1) coral (reef- reef slope; 0-50m), (2) rhodolith (insular shelf 50-150m), (3) Cycloclypeus-Operculina (associated with rhodoliths; 50-150m) and (4) poorly sorted detrital limestones (insular shelf, >50m))

Isern, A., J.A. McKenzie & D.R. Muller (1993)- Paleoceanographic changes and reef growth off the northeastern Australian margin: stable isotope data from Leg 133, Sites 811 and 817 and Leg 21 Site 209. Proc. Ocean Drilling Program (ODP), Scientific Results, 133, p. 263-280.
(online at: www-odp.tamu.edu/publications/133_SR/VOLUME/CHAPTERS/sr133_19.pdf)
(Oxygen isotopes from Holes 811A, 817A indicate extensive reef growth on Queensland Plateau in M Miocene before 12 Ma, signifying surface-water T of 20°C or more. Decrease in reefal detritus in Late Miocene (10.0-5.2 Ma) corresponds with isotopic data from planktonic foraminifera suggesting cooler surface waters (16°-19°C). This may have contributed to demise of reefs on Queensland Plateau. Surface waters remained cool until M Pleistocene (1.2- 0.5 Ma), when surface-water T increased to 25 °C and Great Barrier Reef initiated)

(Aragonitic coral reefs already common in SE Asia by M Oligocene. Gradual change from calcite-dominance to aragonite seas through Oligocene- E Miocene associated with gradual expansion of scleractinia, green algae and mollusks, and associated decline in abundance of calcitic larger foraminifera, resulting in LF being minor component of carbonate faunas by end of M Miocene. LF extinction events reduced diversity, and appear to correlate with periods of tectonic change. Change from seasonal to ever-wet conditions around Oligo-Miocene boundary around S China Sea does not appear caused by a wider tectonic event, but did not impact LF diversity. Combined tectonic unconformity and mass extinction of LF in middle M Miocene times possibly due to plate tectonic constriction of Indonesian Throughflow between Pacific and Indian Oceans)

Lunt, P. & P. Woodroof (2023)- Tectono-stratigraphic controls on Cenozoic Southeast Asian carbonates. In: E.C. Rankey & M.C. Poppelreiter (eds.) Cenozoic isolated carbonate platforms- Focus Southeast Asia, Society for Sedimentary Geology (SEPM) Special Publ. 114, p. 85-110.

(Variety of M. Miocene- Lower Pliocene carbonate accumulations off Vietnam. Best reservoirs in large, fault-controlled, buildups which have undergone extensive leaching during emergence. Moderate reservoir quality in platform facies which extend over large areas and in small buildups usually developed on footwall crests)

McCaffrey, J.C., S.J. Gallagher, M.W. Wallace, T. Averes, S.G. Fabian, K. Lindhorst et al. (2025)- The Rowley Shoals atolls: remnants of a Miocene great barrier reef on the north-west Australian margin. Global and Planetary Change 245, 104688, p. 1-18.
(online at: https://www.sciencedirect.com/science/article/pii/S0921818124003357)
(Three modern West Australian Rowley Shoals are remnants of 2000 km long M-L Miocene barrier reef. These ~250m high isolated atolls persisted during drowning of underlying barrier reef. Fourth shoal drowned during Pliocene due to reduced Leeuwin Current and constriction of Indonesian Throughflow after ~2.4 Ma)

McCaffrey, J.C., M.W. Wallace & S.J. Gallagher (2020)- A Cenozoic Great Barrier Reef on Australia's North West shelf. Global and Planetary Change 184, 103048, p.
(Great Barrier Reef-sized barrier reef (~2000 km long) on NW Australia margin in M Miocene. Reef initiated in Oligocene (~34-28 Ma) and reached peak as prograding barrier reef in M Miocene (16-15 Ma). Backstepping in late Miocene (~10 Ma), formed series of isolated atolls and pinnacle reefs, some still surviving today (Rowley Shoals, Scott, Seringapatam and Ashmore Reefs). Initiation of reef growth related to Australia's N-ward drift into lower latitudes, combined with warm M Miocene climatic optimum conditions and possible changes in paleoceanography. High rates of subsidence probably caused ultimate demise of barrier reef system and widespread backstepping).

McKenzie, J.A. & P.J. Davies (1993)- Cenozoic evolution of carbonate platorms on the Northeastern Australian margin: synthesis of Leg 133 drilling results. In: J.A. McKenzie et al. (eds.) Proc. Ocean Drilling Program (ODP), Scientific Results 133, p. 763-770.

Roberts, H.H. & C.V. Phipps (1988)- Proposed oceanographic controls on modem Indonesian reefs: a turn-off/turn-on mechanism in a monsoonal setting. In: J.H. Choat et al. (eds.) Proc. 6th International Coral Reef Symposium, Townsville 1998, 3, p. 529-534.
(In E Java Sea mutually exclusive occurrences of coral reefs and Halimeda bioherms: coral reefs in depths <15m, extensive areas of 20-50m thick Halimeda bioherms between 20-100m. Unusual success of Halimeda at expense of reef-building corals appears related to nutrient overloading as modulated by monsoon cycle. Strong E-to-W surface flow during E monsoon induces upwelling along western platform margins. Deformation of shallow thermocline where nutrients concentrate (50-100m) brings this deeper Pacific throughflow water to platform margins and top)

Saller, A.H. & R.B. Koepnick (1990)- Eocene to Early Miocene growth of Enewetak Atoll; insight from strontium-isotope data. Geological Society of America (GSA) Bull. 102, 3, p. 381-390.

(Limestone at Ujung Genteng beach, SW Java, with three Acropora coral associations, tied to 0-13m paleobathymetry. (Quaternary age?))

Santoso, W.D., Y. Zaim & Y. Rizal (2018)- Paleontology of *Acropora* corals and standard facies belt from Ujunggenteng area, West Java. J. RISET Geologi dan Pertambangan (LIPI) 28, 2, p. 129-140.
(online at: http://jrisetgeotam.com/index.php/jrisgeotam/article/view/799)
(4 species of branching coral genus Acropora in Quaternary limestones exposed along Ujunggenteng beach)

Saqab, M.M. & J. Bourget (2015)- Controls on the distribution and growth of isolated carbonate build-ups in the Timor Sea (NW Australia) during the Quaternary. Marine and Petroleum Geology 62, p. 123-143.
(Quaternary isolated carbonate build-ups common on NW Australia shelf/ Bonaparte Basin: 1-30 km wide, in clusters of ~150 build-ups, 2-85 km from edge of 650 km-wide continental shelf. Mainly 'Halimeda bioherms'. Distribution of buildups impacted by fault activity, starting in latest Miocene- E Pliocene (initial collision of Australian Plate with Banda Arc, increasing and peaking in E Pleistocene), causing flexural reactivation of structural highs and lows along shelf-margin. Seismic evidence of moat channels and drift deposits suggest contour current activity intensified in late E Pleistocene (~1 Ma). Despite good conditions, buildups did not form until M Pleistocene (~0.58- 0.8 Ma), corresponding to onset of major sea level fluctuations)

Starger, C.J., P.H. Barber, Ambariyanto & A.C. Baker (2010)- The recovery of coral genetic diversity in the Sunda Strait following the 1883 eruption of Krakatau. Coral Reefs 29, 3, p. 547-565.
(Genetic diversity has largely recovered on reefs decimated by eruption of Krakatau in 1883. Recolonization occurred mainly from Pulau Seribu, but also larval input from other regions. Recovery of genetic diversity in coral reef animals can occur on order of decades and centuries rather than millennia)

Sun, S.Q. & M. Esteban (1994)- Paleoclimatic controls on sedimentation, diagenesis and reservoir quality: lessons from Miocene carbonates. American Assoc. Petroleum Geol. (AAPG) Bull. 74, 4, p. 519-543.
(Reservoir quality of Miocene carbonates primarily controlled by prevailing paleoclimate. Two end members: (1) humid, oceanic tropical-subtropical settings (e.g. Miocene of SE Asia). Warming trend and rising sea level allowed thick coral reefs and skeletal banks to develop. Typically several 3rd-order cycles, separated by discontinuities in platform growth with subaerial exposure, with porosity development associated with meteoric leaching and karstification. Basal transgressive carbonates mostly tight; (2) arid, land-locked temperate-subtropical settings with elevated salinities and relatively low temperature restricting growth of buildups. Mainly thin, narrow fringing coral reefs with small lagoons in rhodalgal ramps, with minimal meteoric dissolution during subaerial exposure. Evaporitic lagoons cause of pervasive dolomitization, leaching and generation of moldic, vuggy and intercrystalline porosity. Often with anhydrite cement)

Wallace, C.C. & J. Wolstenholme (1998)- Revision of the coral genus *Acropora* (Scleractinia: Astrocoeniina: Acroporidae) in Indonesia. Zoological J. Linnean Society 123, p. 199-384.
(online at: https://pmc.ncbi.nlm.nih.gov/articles/PMC7165868/pdf/ZOJ-123-199.pdf)
(Review of 83 species of coral genus Acropora is reviewed from Indonesia, based on collections from 131 sites in 1993-1996. Species of Acropora in Indonesian waters include (1) five known only from Indian Ocean and Indonesia, (2) seven from Pacific Ocean, South China Sea and Indonesia, (3) 10 species apparently endemic to Indonesia, and (4) widespread Indo-Pacific species)

Watanabe, T., M.K. Gagan, T. Correge, W.S. Hantoro, H. Scott-Gagan, J. Cowley, G.E. Mortimer & M.T. McCulloch (2002)- Palaeoclimate reconstruction using *Diploastrea* and *Porites* corals from Alor in Eastern Indonesia. Proc. 31st Annual Conv. Indonesian Association Geologists (IAGI), Surabaya, 2, p. 645. *(Abstract only?)*
(Alor in Banda Sea is in core of Indo-Pacific warm Pool. 18O isotopes of coral growth stages used to monitor inter-annual climate changes. El Nino events in last 30 years clearly reflected by increased 18O)

Webster, J.M., J.C. Braga, D.A. Clague, C. Gallup, J.R. Hein, D.C. Potts, W. Renema, R. Riding et al. (2009)- Coral reef evolution on rapidly subsiding margins. Global and Planetary Change 66, p. 129-148.
(online at: https://robertriding.com/pdf/websteretal2009_1.pdf)
(Series of submerged coral reefs in Huon Gulf (PNG) and around Hawaii. Rapid subsidence (2-6 m/ka over last 500 ka), combined with eustatic sea-level changes, responsible for repeated drowning and backstepping of coral reefs. Reef drowning characterized by distinct biological and sedimentary sequence. In short term, rate and amplitude of eustatic sea-level changes control initiation, growth, drowning or sub-aerial exposure, subsequent reinitiation, and final drowning. Over longer time scales (>100-500 ka) tectonic subsidence and basement substrate morphology influence reef morphology and backstepping geometries)

Webster, J.M., L. Wallace, E. Silver, B. Applegate, D. Potts, J.C. Braga & C. Gallup (2004)- Drowned carbonate platforms in the Huon Gulf, Papua New Guinea. Geochem. Geophysics Geosystems 5, 11, Q11008, p. 1-31.
(online at: http://onlinelibrary.wiley.com/doi/10.1029/2004GC000726/pdf)
(W Huon Gulf actively subsiding foreland basin with 14 drowned carbonate platforms and many pinnacles/ banks, increasing in age (~20-450 kyr) and depth (0.1-2.5 km) NE to Ramu- Markham Trench. Superimposed on downward flexing of platforms toward trench is tilting of deep platforms to NW and shallow platforms to SE. This may reflect encroaching thrust load from NW (Finisterre Range). Over shorter time scales (~100 kyr) eustatic sea level changes critical in controlling initiation, growth, drowning of platforms. Tectonic subsidence and basement morphology influence backstepping geometry and tilting of platforms over longer timescales)

Webster, J.M., L. Wallace, E. Silver, D. Potts, J.C. Braga, W. Renema, K. Coleman-Riker & C. Gallup (2004)- Coralgal composition of drowned carbonate platforms in the Huon Gulf, Papua New Guinea: implications for lowstand reef development and drowning. Marine Geology 204, p. 59-89.
(Coral, algae, larger forams facies models and development of Pleistocene carbonate platforms, Huon Gulf. Facies from shallow to deep: 1. Coral reef lst (reef flat-upper reef slope <20m; with Calcarina), 2. Coralline algal- foraminiferal nodule limestone, 3. Halimeda limestone (deep fore-reef slope ~20-60m; with Amphistegina, Heterostegina, Operculina), 4. Coralline algal- foraminiferal crust limestone (deeper fore-reef slope ~60-90m; with Amphistegina, Cycloclypeus, Heterostegina operculinoides, Operculina) and 5. Planktonic foraminifera limestone (with Amphistegina, Cycloclypeus, Heterostegina))

Whitehouse, F.W. (1973)- Coral reefs of the New Guinea Region. In: O.A. Jones & R. Endean (eds.) Biology and geology of coral reefs, 1, Academic Press, New York, p. 169-186.

Wichmann, C.E.A. (1912)- On the so-called atolls of the East-Indian Archipelago. Proc. Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam, 14, p. 698-711.
(online at: https://dwc.knaw.nl/DL/publications/PU00013229.pdf)
(Dutch version online at: https://www.delpher.nl/nl/boeken/view?identifier=MMKB31:036997000:00009)
(Review of distribution of modern coral reefs in Indonesia. Most are fringing reefs and patch reefs. True atolls or barrier reefs are absent or virtually so in the East Indies Archipelago)

Wienberg, C., H. Westphal, E. Kwoll & D. Hebbeln (2010)- An isolated carbonate knoll in the Timor Sea (Sahul Shelf, NW Australia): facies zonation and sediment composition. Facies 56, 2, p. 179-193.
(Facies and biota description of Pee Shoal in Timor Sea. Steep and flat-topped knoll. Facies zonation: (A) scarce sponges, hydrozoans and crinoids (320-210m water depth); (B) hardground outcrops (step-like banks, vertical cliffs) colonized by octocorals and sponges (210-75m); (C) summit region (75-21m) slopes merge gently into flat-topped summit, colonized by massive and encrusting corals and octocoral Heliopora. Sediments from summit dominated by Halimeda)

(First research of Bay of Jakarta coral reef islands since Umbgrove in 1927. Several rel. minor changes. With outline of modern floral zonation on coral islands (incl. marine algae and sea weeds)

XI. INDONESIA- SE ASIA: PALEONTOLOGY, BIOSTRATIGRAPHY

The following chapters on paleontology-biostratigraphy papers tend to be of a more general nature. Numerous additional papers with biostratigraphy content that are case studies with geological implications for specific areas, are listed under those areas;and are not repeated here. These chapters also include titles from Circum-Indonesian areas that may be relevant for interpretations of Indonesian materials.

XI.1. Quaternary/Recent faunas-microfloras and distribution, Biogeography

Adisaputra, Mimin Karmini (1985)- Paleontological analyses of the Sawu Basin, Lombok basin and Argo abyssal plain. Proc. 14th Annual Conv. Indonesian Association Geologists (IAGI), Jakarta, p. 205-221.
(online at: https://www.iagi.or.id/web/digital/40/PIT_IAGI_1985_paper19.pdf)
(Recent foraminifera distribution in seafloor samples collected during Snellius-II Expedition)

Adisaputra, Mimin K. (1988)- Late Quaternary calcareous nannoplankton in the surface sediment of Makasar and Flores basin, Indonesia. Bull. Marine Geological Institute 3, 1, p. 25-36.

Adisaputra, Mimin K. (1989)- Planktonic foraminifera in recent bottom sediments of the Flores, Lombok and Savu Basins, eastern Indonesia. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 24, 4, p. 465-475.
(Planktonic foraminiferal assemblages differ between Flores, Lombok and Savu Basins. In Flores Basin Ng. dutertrei dominant, followed by Gr. menardii, Pulleniatina obliquiloculata, Hastigerina siphonifera and Globigerina bulloides. Lombok and Savu Basins dominated by Gr. menardii, with Pulleniatina obliquiloculata, Gs. ruber and Gr. tumida)

Adisaputra, Mimin K. (1991)- Mikrofauna dan potensi wisata perairan Benoa, Bali. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 1, 2, p. 2-6.
('Microfauna and recreational potential of the water of Benoa, Bali'. Beach sand at Benoa, S of Denpasar, SE Bali, contains abundant foraminifera of genus Schlumbergerella, also Amphistegina lessoni, Calcarina calcar, Tinoporus spengleri, Baculogypsisna sphaerulata, Operculina, etc.)

Adisaputra, Mimin K. (1992)- Mikrofauna perairan Muria. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 2, 5, p. 11-16.
('Microfauna in the waters of Muria'. Shallow marine small benthic forams of Java Sea N of Muriah volcano. At less than 20m common Ammonia beccarii, Eponides praecinctus and Asterorotalia trispinosa. In deeper parts more Ammonia annectens, Pseudorotalia schroeteriana and Quinqueloculina. Not much detail)

Adisaputra, Mimin K. (1992)- Late Neogene planktonic foraminifera of the Makasar Basin. Bull. Marine Geological Institute 7, 1, p. 15-21.
(Abundant planktonic foraminifera in Makassar Straits bottom samples between 42-2300m, collected during Snellius II expedition. Globigerinoides ruber dominant in North, Neogloboquadrina dutertrei in S part)

Adisaputra, Mimin K. (1996)- Planktonic foraminifera and oxygen isotope records in two cores from the Banda Sea and Indian Ocean. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 6, 57, p. 10-17.
(Study of Quaternary planktonic foraminifera from two ~7-8m long French- Indonesian cores collected in 1990, one SW of Timor (2313m), one in Banda Sea depth (3163m). Neogloboqudrina dutertrei is indicator of rel. low salinity, Globorotalia menardii for rel. high salinity)

Adisaputra, Mimin K. (1996)- Biostratigrafi kuarter sedimen dasar laut perairan Indonesia bagian Timur dan Samudera Hindia. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 6, 59, p. 2-6.
('Stratigraphy of Quaternary seafloor sediments in waters of eastern Indonesia and the Indian Ocean'. Study of Quaternary planktonic foraminifera from 46 seven meter long seafloor cores in deep waters of E Indonesia and adjacent Indonesian Ocean. Four subzones in Quaternary Globorotalia truncatulinoides zone (N22-N23), from

top: (1) Globorotalia fimbriata- Bolliella adamsi, (2) Globigerina calida, (3) Globorotalia crassaformis hessi and (4) Globigerinoides cyclostomus))

Adisaputra, Mimin K. (1997)- Foraminifera sedimen permukaa perairan Selat Bangka-Belitung. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 7, 70, p. 2-10.
('Foraminifera from seafloor sediments of Bangka-Belitung Straits'. 38 seafloor samples from straits S of Bangka and Belitung in water depths 10-50m. Dominant foraminifera Operculina ammonoides and other spp., followed by Quinqueloculina, Amphistegina lessonii, Elphidium, Cellanthus, Pseudorotalia schroeteriana, etc.)

Adisaputra, Mimin K. (1998)- *Schlumbergerella floresiana* accumulation in coastal zone of Bali and Nusatenggara, Indonesia: implementation for tourism. Proc. 33rd Session Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Shanghai 1996, p. 310-316.
('White sands' along coasts of E Bali, W Lombok, N Sumbawa and S Flores composed mainly of rounded foraminifera Schlumbergerella floresiana (formerly also called Tinoporus, Baculogypsina, Baculogypsinoides; JTvG). Forams derived from adjacent coral reefs)

Adisaputra, Mimin K. (1998)- Foraminifera bentos pantai Senggigi, Lombok Barat dan asosiasinya; faktor penunjang pariwisata. Proc. 27th Annual Conv. Indonesian Association Geologists (IAGI), 2 (Sedimentology Paleontology Stratigraphy), Yogyakarta, p. 53-65.
(online at: https://www.iagi.or.id/web/digital/56/32.pdf)
('Benthic foraminifera of Senggigi Beach, W Lombok, and its associations; factors supporting tourism'. Senggigi beach with abundant foraminifera derived from adjacent reef flat, dominated by Schlumbergerella floresiana. Also Baculogypsina, Baculogysinoides spinosus, Amphistegina lessonii, Calcarina calcar))

Adisaputra, Mimin K. (2000)- Recent foraminifera on the coast and offshore of East Lombok, Eastern Indonesia. Proc. 36th Session Coord. Comm. Coastal and Offshore Programmes E and SE Asia (CCOP), Hanoi 1999, p. 181-200.
(Benthic foraminifera from East Lombok coast and Alas Strait shallow waters down to 90m. In N and central parts Amphistegina lessonii dominant and associated with Calcarina. In S Asterorotalia ('Rotalinoides') gaimardii dominant, still with Amphistegina. Beach samples in N with common Schlumbergerella and Baculogypsinoides, derived from coral reef. Planktonic foraminifera rare)

Adisaputra, Mimin K. (2000)- Late Neogene planktonic foraminiferal biostratigraphy of two cores in Timor waters, Indonesia. Majalah Geologi Indonesia (IAGI) 24, 1, p. 39-50.

Adisaputra, Mimin K. & M. Hendrizan (2011)- Foraminifera perairan Balikpapan, Kalimantan Timur: lingkungan pengendapan dan pengaruhnya. J. Geologi Kelautan 9, 2, p. 119-133.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/205/195)
('Foraminifera from waters off Balikpapan, East Kalimantan: depositional environment and its effects'. 195 benthic and 34 planktonic foraminifera species in Makassar Straits seafloor samples off Balikpapan, between 18-562m depth. Asterorotalia trispinosa dominant around 20m, Heterolepa praecincta most abundant from ~50-300m, Karreriella brady and Uvigerina spp. common only >300m, etc. Cycloclypeus only at 71 and 83m. Abundant planktonic foraminifera Neogloboquadrina dutertrei below 100m, indicating rel. low salinity.)

Adisaputra, Mimin K., M. Hendrizan & A. Kholiq (2010)- Katalog foraminifera perairan Indonesia. Pusat Puslitbang Geologi Kelautan, Bandung, p. 1-198.
('Catalog of Foraminifera collected from Indonesian seas')

Adisaputra, Mimin K. & D. Rostyati (2000)- Recorded Recent foraminifera in the surface sediment of Sunda Strait water. Proc. 29th Annual Conv. Indonesian Association Geologists (IAGI), Bandung, 4, p. 117-132.
(Foraminifera from 12 seafloor samples in Sunda Straits and adjacent Indian Ocean between 52- 2180m. Rel. common planktonic foram Neogloboquadrina dutertrei, possibly related to rel. low salinity. Most common benthics Bulimina and Bolivina (mostly 490-1580m). Hyalinea balthica between 489-1078m)

Adisaputra, Mimin K. & D. Rostyati (2003)- Foraminifera sedimen dasar Laut Delta Mahakam, Kalimantan Timur. J. Geologi Kelautan 1, 3, p. 1-10.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/98/88)
('Foraminifera in sediments offshore Mahakam Delta, E Kalimantan'. Foram distribution in samples mainly from 10-100m water depth. 39 species of planktonic, 149 benthic foraminifera. Common benthics Amphistegina lessonii, Heterolepa, Operculina and Pseudorotalia schroeteriana. Max. diversity at depth of 63,5 m)

Amijaya, H., Ngisomuddin & Akmaluddin (2010)- Characterization of July 17, 2006 tsunamiite at South coast of West Java. J. Southeast Asian Applied Geology (UGM) 2, 1, p. 35-39.
(online at: https://journal.ugm.ac.id/index.php/jag/article/viewFile/7232/5672)
(Deposits of July 26 tsunami at Pangandaran Beach, W Java. Mainly f-m sand, ~10-12cm thick, separated from older beach sediment by erosional surface. Sedimentary structures parallel lamination and current ripples. No vertical fining trends. With transported shallow and deeper marine benthic foraminifera, incl. Ammonia, Elphidium, Amphistegina, Cibicides., Biginerina, Bolivina, Bathysiphon, Nodosaria and Quinqueloculina)

Anderson, J.A.R. (1963)- The flora of the peat swamp forests of Sarawak and Brunei, including a catalogue of all recorded species of flowering plants, ferns and fern allies. Singapore Gardens Bull. 20, p. 131-228.
(All modern coastal and deltaic peat swamps of N Borneo raised bog type. 243 plant/tree species, in 6 communities: 1) Mixed swamp forest, 2) Alan forest, 3) Alan bunga forest, 4) High pole forest, 5) Low pole forest, 6) Padang keruntum)

Ardi, R.D.W, Aswan, K.A. Maryunani, E. Yulianto, P.S Putra & S.H. Nugroho (2023)- First occurrence of planktonic foraminiferal species *Boliella adamsii* as a marker for the Pleistocene-Holocene boundary in the sea around Sumba Island. Proc. Second Int. Seminar on Earth Sciences and Technology (ISEST-2023), Bandung, IOP Conference Series: Earth and Environmental Science 1245, 012025, p. 1-12.
(online at: https://iopscience.iop.org/article/10.1088/1755-1315/1245/1/012025/pdf)
(Pleistocene- Holocene boundary depth in cores off Sumba Island nearly coeval with first occurrence of planktonic foraminifer Boliella adamsii (N.B.:both genus and species names missspelled; should be Bolliella adamsi; JTvG))

Ardi, R.D.W., Aswan, K.A. Maryunani, E. Yulianto, P.S Putra & S.H. Nugroho (2023)- Sea surface paleoproductivity reconstruction based on foraminiferal accumulation rate in the western Savu Strait since the Last Glacial Maximum (~23 ka BP). Rudarsko-Geolosko-Naftni Zbornik (Mining-Geology-Petroleum Engineering Bulletin), Zagreb, 38, 1, 62, p. 167-178.
(online at: https://hrcak.srce.hr/ojs/index.php/rgn/article/view/23308/13606)

Ardi, R.D.W., K.A. Maryunani, E. Yulianto, P.S Putra & S.H. Nugroho (2019)- Biostratigrafi dan analisis kedalaman termoklin di Lepas Pantai Barat Daya Sumba sejak Pleistosen Akhir berdasarkan kumpulan foraminifera planktonik. Bulletin of Geology (ITB) 3, 2, p. 355-362.
(online at: https://buletingeologi.com/index.php/buletin-geologi/issue/download/8/Paper%203%20-%20Ryan%20Dwi%20Wahyu%20Ardi)
('Biostratigraphy and thermocline depth analysis in the Southwest Sumba Offshore since the Late Pleistocene based on planktonic foraminifera assemblages'. Late Pleistocene- Holocene 235cm long deep marine core S8, off SW Sumba. Relatively abundant thermocline dwellers Neogloboquadrina dutertrei, Pulleniatina obliquiloculata and Globorotalia menardii during Pleistocene, indicating shallower thermocline (eutrophic condition), and tied to SE monsoon domination during Pleistocene (stronger Indonesian Throughflow))

Aswan, Y. Zaim & Y. Rizal (2006)- Distribution of Quarternary freshwater molluscs fossils in Jawa. In: Y. Zaim et al. (eds.) S. Sartono: dari hominid ke delapsi dengan kontroversi, Penerbit ITB, Bandung, Chapter 9, p. 109-120.

Auliaherliaty, L., K.T. Dewi & Y.A. Priohandono (2004)- Foraminifera di Teluk Sepi- Blongas, Lombok selatan, Nusa Tenggara Barat dan kaitannya dengan faktor lingkungan. J. Geologi Kelautan 2, 3, p. 1-8.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/115/105)

(Seafloor sediment samples of 1-78m in Sepi-Blongas Bay, S Lombok, with 133 foraminiferal species, mainly Ammonia beccarii, Elphidium crispum, Pattelina, Amphistegina lessonii, Calcarina, Pyrgo, Quinqueloculina, etc. Genus Calcarina with 15 species (?))

(Descriptions and environmental conditions of 1000 species of Recent foraminifera found around New Caledonia)

Debenay, J.P. & G. Cabioch (2007)- Recent and Quaternary foraminifera collected around New Caledonia. In: Compendium of marine species of New Caledonia, Documments Scientifiques Techniques II-7, Institut de Recherche pour le Developpement (IRD), Noumea, New Caledonia, p. 69-94.
(online at: www.ird.nc/biodec/downloads/Compendium/Version%20v%E9rrouill%E9e/Debenay-Cabioch-v.pdf)
(Listing and some illustrations of modern forams around New Caledonia)

Debenay, J.P. & C.E. Payri (2007)- Epiphytic foraminiferal assemblages on macroalgae in reefal environments of New Caledonia. J. Foraminiferal Research 40, 1, p. 36-60.
(online at: http://jfr.geoscienceworld.org/content/40/1/36.full.pdf)
(152 species of epiphytic foraminifera identified from New Caledonia)

De Deckker, P. & F.X. Gingele (2002)- On the occurrence of the giant diatom *Ethmodiscus rex* in an 80-ka record from a deep-sea core, southeast of Sumatra, Indonesia: implications for tropical palaeoceanography. Marine Geology 183, p. 31-43.
(Deep-sea core from water depth 2542 m off SE Sumatra shows 'blooms' of giant diatom Ethmodiscus rex in Indian Ocean during last glacial period, particularly in Last Glacial Maximum. Blooms caused by increases in salinity and nitrate levels near surface. No major upwelling recorded during glacial times. During glacial period Indonesian Archipelago was much drier, preventing low-salinity 'cap' at surface of oceans)

De Neve, G.A. (1949)- Foraminifera from the shore zone of the Islands of Roeang and Siaoe. Chronica Naturae 105, 4, p. 113-115.
(online at: http://colonial.library.leiden.edu/….)
(Recent benthic foraminifera in shoreline sands of islands between Sulawesi and Philippines. Mainly miliolids, Robulus, Elphidium, Heterostegina, Amphistegina, Calcarina spp., Baculogypsina sphaerulata)

De Neve, G.A. (1949)- Opmerkingen over een foraminifenhoudende kalksteen van Baranti op het schiereiland Sanggar (Soembawa) en de strandzanden van Poeloe Ngali (Salehbaai) en Poeloe Madang. Chronica Naturae 105, 4, p. 116-118.
(online at: http://colonial.library.leiden.edu/….)
('Remarks on a foraminifera-bearing limestone of Baranti on the Sanggar Peninsula (Sumbawa) and the beach sands of Pulau Ngali (Saleh Bay) and Pulau Madang'. Late Neogene limestone similar to described by Tobler (1918), with Schlumbergerina, Alveolinella quoyi, Calcarina spp., Baculogypsina sphaerulata, etc.

Baculogypsina tetraedra n.sp. described by Tobler (1918) from this area is probably synonym of Tinoporus baculatus and T. floresianus (Schlumberger))

De Neve, G.A. (1949)- Foraminifera from the shore zone of the islands of Morotai and Ternate. Chronica Naturae 105, 7, p. 196-198.
(online at: http://colonial.library.leiden.edu/....)
(Recent foraminifera from beach sand samples of SW Molotai and Ternate: Quinqueloculina, Robulus, Elphidium, Heterostegina, Orbitolites, Rotalia gaimardii, Amphistegina radiata, Calcarina spp., Baculogypsina sphaerulata. With summary of foraminifera from deep water samples off W Halmahera from 'Albatross-Expedition', as reported by Cushman (1921))

De Neve, G.A. (1949)- Foraminifera from the shore zone of Parigi and Poso (Gulf of Tomini). Chronica Naturae 105, 10, p. 252-254.
(online at: http://colonial.library.leiden.edu/....)
(Recent foraminifera from beach sand samples near Parigi and Poso, C Sulawesi. Up to 13 species, incl. miliolids, Elphidium, Operculina, Verbeekia, Orbitolites, Siderolites tetraeda and Calcarina. With summary of Gulf of Tomini deep water samples (1240-1966m) from 'Albatross-Expedition', as reported by Cushman (1921))

De Neve, G.A. (1949)- Een notitie over de foraminiferen van de oudste diepzee-lodingen in Indonesia. Chronica Naturae 105, 11, p. 291-292.
(online at: http://colonial.library.leiden.edu/....)
('Note on the foraminifera from the oldest deep sea soundings in Indonesia'. Brief note on earliest descriptions of deep sea foraminifera from Indonesia by Ehrenberg (1854) and Harting (1861, 1864))

De Silva, L.P. & P.J. Militante-Matias (1998)- Foraminiferal assemblages of Pagbilao Bay, Philippines. J. Geological Society of the Philippines 53, 1-2, p.
(134 foram species identified, representing 7 foraminiferal assemblages: river mouth, intertidal zone- Patayan Island, intertidal zone- Bocboc point, beach, reef/carbonate platform, inner bay, and inner bay channel. Nature of substrate strongly influences distribution of shallow water benthic foraminifera)

Dewi, K.T. (1993)- Ostracoda from the Java Sea, West of Bawean Island, Indonesia. Masters Thesis, University of Wollongong, Australia, p. 1-165.
(online at: https://ro.uow.edu.au/theses/2832)
(Seafloor samples from Sunda Shelf W of Bawean island contain 113 species of ostracodes, including 7 new)

Dewi, K.T. (1997)- Ostracoda from the Java Sea, West of Bawean Island, Indonesia. Marine Geology Institute (MGI), Bandung, Special Publ. 4, p. 1-86.
(same as Kresna Tri Dewi (1993) above; Masters Thesis, University of Wollongong, Australia)

Dewi, K.T. (2014)- Ostracoda from subsurface sediments of Karimata Strait as indicator of environmental changes. Bulletin of the Marine Geology 29, 1, p. 1-10.
(online at: ejournal.mgi.esdm.go.id/index.php/bomg/article/download/60/61)
(43 species of ostracods from 3 short seafloor cores of Sunda Shelf, in water depth 11-27m. Highest abundance/ diversity in upper 70cm of cores. Main genera Actinocythereis, Hemicytheridea, Loxoconcha, Neocytheretta, Stigmatocythere, Neomonoceratina, Phlyctenophora, Argillloecia, etc. (see also Mostafawi 1992))

Dewi, K.T., I. Adhirana, Y.A. Priohandono & L. Gustiantini (2016)- Ostracoda sebagai indikator perubahan lingkungan perairan sekitar PLTU Tarahan, Teluk Lampung, Sumatera. J. Geologi Kelautan 14, 1, p. 1-12.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/335/263)

('Ostracoda as indicators of marine environmental changes off the Tarahan power plant, Lampung Bay, Sumatera'. Ostracods from surface sediments in Lampung Bay quite diverse and abundant, with 27 genera, dominated by Keijella, Hemicytheridea and Cytherella. Also locally abundant Bairdopillata)

Dewi, K.T., L. Arifin, A. Yuningsih & Y. Permanawati (2012)- Meiofauna (Foraminifera) dalam sedimen dan keterkaitannya dengan pantai pasir putih Senggigi serta kondisi perairan Lombok Barat. J. Ilmu Teknologi Kelautan Tropis 4, 1, p. 47-54.
(online at: www.itk.fpik.ipb.ac.id/ej_itkt41/jurnal/...)
('Meiofauna (Foraminifera) in sediments and its association with the white sand beaches and water conditions of Senggigi, West Lombok'. Schlumbergerella floresiana abundant in white sands of Senggigi beach, but not common in offshore samples)

Dewi, K.T., N.C.D. Aryanto & Y. Noviadi (2007)- Land-sea interactions in coastal waters off NE Kalimantan: evidence from microfaunal communities. Bulletin of the Marine Geology 22, 1, p. 1-15.
(online at: ejournal.mgi.esdm.go.id/index.php/bomg/article/download/1/1)
(Microfauna in seafloor samples in 14-43m deep water off Nunukan and Sebatik islands in NE Kalimantan with typical microfauna of shallow marine ostracoda (Hemicytheridea spp., Keijella spp., Cytherella) and foraminifera (Asterorotalia trispinosa, Operculina))

Dewi, K.T., P. Frenzel & A. Muller (2008)- Mikrofauna (ostracoda) di sekitar paparan Sahul dan Laut Banda dalam kaitannya dengan batimetri. Proc. 37th Annual Conv. Indonesian Association Geologists (IAGI), Bandung, 1, p. 127-138.
(online at: https://www.iagi.or.id/web/digital/14/2008_IAGI_Bandung_Mikrofauna-di-Sekitar-Paparan.pdf)
(Study of recent ostracods distribution in Snellius II samples along transects from Timor, Tanimbar, Seram into Banda Sea down to 3070m. Highest number of ostracods between 100-210m water depth, with Bairdopillata, Neonesidea, Paranesidea, Paracytheridea, Hemiparacytheridea, Foveoleberis, Polycope and Loxoconcha)

Dewi, K.T., P. Frenzel, A. Muller & D. van Harten (2004)- Recent ostracoda (microcrustacea) from a Banda-to-Timor Sea traverse: implications for paleobathymetric studies. Proc. 33rd Annual Conv. Indonesian Association Geologists (IAGI), Bandung, 1, p. 42-51. *(online at: www.researchgate.net/profile/Peter-Frenzel/publication/255979013_Recent_Ostracoda_Microcrustac Etc.)*
(146 species of ostracods in surface sediments between 100-3070m along Banda Sea- Leti Strait-Timor Sea transect, E of Timor island. Richest assemblages in <100m water; abundance and diversity decreases with depth. Bathyal zone characterized by Cytheropteron, Saida, Bradleya, Paleocythere, Henryhowella, Krithe and Parakrithe; lower bathyal by Acantocythereis, Agrenocythereis and Krithe- Parakrithe spp.; abyssal depths by Argilloecia, Xestoleberis, Cytheropteron)

Dewi, K.T. & M. Hanafi (2013)- Karakteristik komunitas foraminifera laut dalam di Teluk Tomini, Sulawesi. J. Ilmu Teknologi Kelautan Tropis (JITKT; Bogor), 5, 1, p. 17-25.
(online at: http://journal.ipb.ac.id/index.php/jurnalikt/article/view/7742)
('The characteristics of the deep sea foraminiferal community in Tomini Bay, Sulawesi'. Foraminifera from 14 seafloor sediment samples from 600-1400m in Tomini Bay. Samples dominated by planktonic foraminifera (>90%). Benthic foraminifera represented by Cibicidoides wuellerstorfi, Ceratobulimina pacifica, Pyrgo sp., Bolivinita quadrilatera, Uvigerina peregrina, Planulina, etc., also very rare Laticarinina below 1000m)

Dewi, K.T. & D. Illahude (2005)- Ostracoda from off Derawan island, East Kalimantan (LP-1815) in relation to bathymetric zonation. Bulletin of the Marine Geology 20, 1, p. 1-14.
(Depth distribution of Recent ostracoda from 25 seafloor samples at depths 7-628m off Berau/ Tarakan Rivers, NE Kalimantan. 142 species identified. Common ostracods in area around reef complex, with Bairdopillata paracratericola, B. paraalcyanicola and Macrocypris decora. Also high diversity at water depths >200m, with displaced shallow water ostracods and deep water fauna. Bradleya common deepwater ostracod, found from <50m to >500m)

Dewi, K.T., A. Muller, P. Frenzel, L. Auliaherliaty & L. Gustiantini (2003)- Do Quaternary ostracods reflect sea level changes in the Timor Sea? Proc. 32nd Annual Conv. Indonesian Association Geologists (IAGI) and 28th Annual Conv. HAGI, Jakarta, p. 1-11.
(Samples from E of Timor in water depth 1768m show several small ostracod diversity peaks. Peaks of deep-sea taxa like Krithe, Bradleya, Cytheropteron, Acantocythereis and Ambocythere related to changes in paleoproductivity. Other peak with mixed shallow-water (Paracytheridea, Quadracythere, Loxocorniculum, Neonesidea) and deep-sea taxa suggest downslope transport of sediments, possibly regressive events)

Dewi, K.T., N. Nurdin, Y.A. Priohandono & A. Sinaga (2015)- Benthic foraminifera in marine sediment related to environmental changes off Bangka Island, Indonesia. Berita Sedimentologi 33, p. 47-57.
(online at: www.iagi.or.id/fosi/files/2015/09/BS33-Marine-Geology-of-Indonesia-II-R1.pdf)
(60 species of foraminifera in samples from 6-24m water depth offshore E Bangka island. Dominated by Amphistegina, Elphidium, Quinqueloculina, Operculina)

Dewi, K.T. & Y.A. Prihandono (2023)- Mikrofauna (Ostrakoda) dari Teluk Balikpapan; implikasinya untuk interpretasi lingkungan pengendapan. J. Geologi Kelautan 21, 1, p. 13-22.
(online at: https://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/779/585)
('Microfauna (Ostracoda) from Balikpapan Bay: its implication for interpreting depositional environments'. Ostracoda from water depths 1.5-27m 62 species, dominated by shallow marine ostracods Hemicytheridea reticulata, Cytherella semitalis and Alocopocythere kendengensis)

Dewi, K.T., Y.A. Prihandono & H.H. Prabowo (2000)- Ostracoda perairan Utara P. Kangean: kaitannya dengan transpor sedimen. Proc. 29th Annual Conv. Indonesian Association Geologists (IAGI), Bandung, 4, p. 109-116.
('Ostracodes from waters North of Kangean Island; relations to sediment transport'. 30 sediment samples with 30 species, dominated by Bairdopillata, Cytherella, Foveoleberis. Not much detail)

Dewi, K.T. & E. Saputro (2013)- Sebaran spasial foraminifera dalam kaitannya dengan kedalaman laut dan jenis sedimen di Teluk Bone, Sulawesi Selatan. J. Geologi Kelautan 11, 3, p. 165-173.
(online at: http://ejournal.mgi.esdm.go.id/index.php/jgk/article/view/240/230)
('Spatial distribution of foraminifera in relation to water depth and sediment types in Bone Bay, S Sulawesi'. Foraminifera from 23-85m water depth in N Bone Bay mainly Operculina spp., Heterolepa, Pseudorotalia. Absence of 'Sunda species' Asterorotalia trispinosa)

Dharma, B. (2005)- Recent & fossil Indonesian shells. Conch Books, Hackenheim, Germany, p. 1-424.
(Comprehensive monograph/atlas of Recent and fossil molluscs of Indonesia. 1,982 Recent species in 536 genera With 150 plates (plates 111-150 of fossil species)

Dhillon, D.S. (1968)- Notes on the foraminiferal sediments from the Lupar and Labuk estuaries, East Malaysia. In: Geological Papers 1967, Geological Survey Borneo Region, Malaysia, Kuching, Bull. 9, p. 56-73.
(Recent benthic foraminifera distribution in SW Sarawak river estuaries. 46 species. Arenaceous brackish water species found far upriver, while shallow marine hyaline calcareous species dominate near mouth of estuary. Includes new genus with two new species, Gobbettia wilfordi and Gobbettia klompei)

Dhillon, D. S. (1968)- A new genus of the Haplophragmoidinae from Malaysia. Contr. Cushman Foundation Foraminiferal Research 19, 4, p. 140-141.

Dhillon, D.S. (1969)- Three new species of foraminifera from Malaysia. Journal of Paleontology 43, 3, p. 767-770.

(Three new species of arenaceous foraminifera proposed from Recent sediments in Labuk Estuary, SW Sarawak: Arenoparrella malaysiana, Haplophragmoides labukensis, and H. sabahensis (also described in Dhillon (1968))

Ding, X., F. Bassinot, F. Guichard, Q.Y. Li, N.Q. Fang, L. Labeyrie, R.C. Xin, M.K. Adisaputra & K. Hardjawidjaksana (2006)- Distribution and ecology of planktonic foraminifera from the seas around the Indonesian Archipelago. Marine Micropaleontology 58, p. 114-134.
(Planktonic foraminiferal assemblages five provinces: (1) Banda/ Java region; (2) Timor region; (3) Java upwelling region; (4) Indian monsoon Sumatra region, and (5) NW Australia margin region. Assemblages reflect sea-surface temperature, salinity, thermocline depth, and nutrient supply, related to circulation patterns. Strongest dissolution in Java upwelling region, with lysocline rising above 2800m. Increase in Globigerina bulloides at 10-8 ka BP in Java upwelling region corresponds to decrease in Banda/ Java region, indicating intensification of upwelling in relation to strengthened SE monsoon)

Egger, J.G. (1893)- Foraminiferen aus Meeresgrundproben gelothet von 1874 bis 1876 von S.M. Sch. Gazelle. Abhandlungen Bayerischen Akademie Wissenschaften, Mathematisch-Physikalische Klasse 18, 2, p. 193-458.
(online at: https://www.biodiversitylibrary.org/item/110282#page/229/mode/1up)
('Foraminifera from sea floor samples collected between 1874 and 1876 by S.M. Sch. Gazelle'. Classic study of foraminifera from sea floor samples collected by German Gazelle oceanographic expedition. Incl. material from Banda Sea, Raja Ampat islands, etc. (stations 95-99))

Faiz, N.N., K.R. Mohamed & R. Omar (2017)- Species diversity and distribution of ostracoda (Crustacea) in Sungai Kubang Badak, Langkawi, Malaysia. Malayan Nature J. 69, 2, p. 83-92.
(online at: https://www.researchgate.net/publication/325557157_Species_diversity_and_distribution_of_Ostracoda_Crustacea_in_Sungai_Kubang_Badak_Langkawi_Kedah_Malaysia)
(Estuarine-shallow marine ostracode assemblages in Kubang Badak river and river mouth in N Langkawi. 27 species, dominated by Hemicytheridea wangi and Neomonoceratina delicata. Three assemblages. Density and diversity of ostracoda increases from upper estuary to nearshore areas)

Faiz, N.N., K.R. Mohamed, R. Omar & M.N.A. Malek (2017)- Benthic foraminiferal assemblages in the Pahang River Delta (Pahang, Malaysia). Thalassas: An International J. of Marine Sciences 34, 1, p. 65-79.
(Bottom sediments of Pahang River delta (E coast of Malay Peninsula) yielded 88 benthic foraminifera species. Agglutinated foraminifera (Ammobaculites) dominant at river mouth, while calcareous species (Asterorotalia pulchella) dominated in offshore samples)

Faiz, N.N., R. Omar & Basir Jasin (2007)- Taburan ostrakod di dalam sedimen luar pantai di sekitar Pulau Tinggi, Johor. Sains Malaysiana 36, 2, p. 139-148.
(online at: http://journalarticle.ukm.my/112/1/1.pdf)
(Distribution of ostracoda in offshore sediment around Pulau Tinggi, Johor. 11 shallow(?) marine samples off SE Malay Peninsula with 36 genera/ 51 species of ostracods. Dominant species is Loxoconcha malayensis. Sediment mainly m-grained sand)

Faiz, N.N., Ramlan Omar, M.N. Abd Malek, C. Li & Y. Liu (2016)- Taburan dan kepelbagaian Foraminifera bentik di dalam sedimen permukaan sekitar delta Sungai Pahang, Pahang, Malaysia. Sains Malaysiana 45, 5, p. 669-676.
(online at: www.ukm.my/jsm/pdf_files/SM-PDF-45-5-2016/02%20Noraswana%20.pdf)
('The distribution and diversity of benthic Foraminifera in surface sediment of Pahang River Delta, Pahang, Malaysia'. 82 species of Recent benthic foraminifera offshore Pahang River delta. Amphistegina lessonii and A. gibbosa most abundant, followed by Elphidium advenum, Operculina ammonoides and Asterorotalia pulchella. No specifics on water depth of samples or detailed distribution)

Fajemila, O.T., M.R. Langer & J.H. Lipps (2015)- Spatial patterns in the distribution, diversity and abundance of benthic foraminifera around Moorea (Society Archipelago, French Polynesia). PLoS One 10, 12, e0145752, p. 1-25.
(online at: http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0145752)

(380 species of shallow benthic foraminifera from around Moorea)

Fauzielly, L. (2013)- Distribusi vertikal Ostracoda dan hubungannya dengan perubahan lingkungan di perairan Teluk Jakarta. Bull. Scientific Contribution (UNPAD) 11, 2, p. 108-117.

Fauzielly, L., T. Irizuki & Y. Sampei (2012)- Vertical changes of Recent ostrocode asemblages and environment in the inner part of Jakarta Bay, Indonesia. J. Coastal Development 16, p. 11-24.
(Ostracodes from sediment core from the inner part of Jakarta Bay. 53 species, dominated by Keijella carriei and Loxoconcha wrighti, which are common in areas with high organic carbon and nitrogen contents)

Fauzielly, L., T. Irizuki & Y. Sampei (2013)- Spatial distribution of Recent ostracode assemblages and depositional environments in Jakarta Bay, Indonesia, with relation to environmental factors. Paleontological Research (Palaeontological Society of Japan) 16, 4, p. 267-281.
(online at: https://bioone.org/journalArticle/Download?urlId=10.2517%2F1342-8144-16.4.267
(Recent ostracodes of Jakarta Bay 94 species, dominated by Keijella carriei, Hemicytheridea reticulata, Loxoconcha wrighti and Hemicytheridea ornata. Cytherella, Cytherelloidea, Neomonoceratina, and Pistocythereis also abundant. Three biofacies: (I) muddy bottom inner-middle bay with K. carriei, L. wrighti, and H. reticulata. Biofacies; (II) muddy bottom outer bay with H. reticulata, H. ornata and Cytherella spp. (III) sandy mud bottom outer bay high-diversity assemblages with Atjehella kingmai, Foveoleberis cypraeoides, Neomonoceratina bataviana and Pistocythereis cribriformis)

Fauzielly, L., L. Jurnaliah & A.H. Hamdani (2014)- Distribusi foraminifera bentonik sedimen paleo-tsunami letusan Gunung Krakatau berdasarkan data inti bor U-6 Di daerah Ujungkulon, Banten. Bull. Scientific Contribution (UNPAD) 12, 2, p. 84-91.
(online at: http://repository.unpad.ac.id/21772/1/Distribusi-foraminifera-bentonik-sedimen...)
('The distribution of benthic foraminifera in sedimentary paleo-tsunami eruption of Krakatoa based on data from core U-6 in the Ujungkulon area, Banten'. Marine microfossils in onland sediments may indicate paleo-tsunami deposits. Sand with coral debris at 90-120cm in core from Ujung Kulon recognized as tsunami deposit. With 55 species of benthic foraminifera, dominated by Streblus beccarii, Planulina wuellerstorfi, Hyalinea balthica, Bulimina marginata, Bolivina spathulata, Elphidium, Uvigerina peregrina Cushman. Origin of tsunami sediments is (outer) shelf-bathyal and inner shelf lagoon)

Fernando, A.G.S., A.M. Peleo-Alampay & M.G. Wiesner (2007)- Calcareous nannofossils in surface sediments of the eastern and western South China Sea. Marine Micropaleontology 66, p. 1-26.
(Calcareous nannofossils in surface sediments of S China Sea in water depths of 35–4345 m. In shallow/ nearshore waters dominant taxa are Emiliania huxleyi and Gephyrocapsa oceanica. In deeper portion of SCS, Florisphaera profunda dominates. Three assemblages recognized:(a) upwelling, (b) oceanic and (c) deep basin assemblages. F. profunda is relatively resistant to dissolution)

Fitriany, R., L. Jurnaliah & T.Y.W.M. Iskandarsyah (2019)- Small benthic foraminifera as an indicator of paleotsunami in Ujungkulon, Banten Province, Indonesia. J. Geological Sciences Applied Geology (UNPAD) 3, 1, p. 74-78.
(online at: http://jurnal.unpad.ac.id/gsag/article/view/22241/10591)
(55 species of small benthic foraminifera in paleotsunami deposits of the Laban Isthmus, Ujung Kulon Peninsula, SW Java, ~2m below surface. Dominant species Planulina wuellerstorfi, a deep marine species)

Flenley, J.R. (1979)- The Equatorial rain forest: a geological history. Butterworths London, p. 1-162.
(Includes review of SE Asia Cretaceous- Neogene evolution of pollen assemblages and chapter on Quaternary palynology and vegetation changes of SE Asia. In PNG vegetation zones moved downward ~1600m during Pleistocene glacial episodes, suggesting 10°C decline in temperatures (later book with similar title by R.J. Morley (2000) Origin and evolution of tropical rain forests))

Flenley, J.R. (1998)- Tropical forests under the climates of the last 30,000 years. In: A. Markham (ed.) Potential impacts of climate change on tropical forest ecosystems, Climatic Change 39, Kluwer, p. 177-197.
(Incl. review of pollen diagrams from lowlands of SE Asia. Depression of altitudinal vegetation zones during Late Pleistocene Last Glacial Maximum suggests temperatures 5-10°C cooler than now)

Flenley, J.R. (1999)- Problems of the Quaternary on mountains of the Sunda-Sahul region. Quaternary Science Reviews 15, p. 549-555.
(In montane areas in Sunda-Sahul region Upper Montane rainforest appears to be absent in Late Pleistocene. Estimates of temperature lowering in Late Pleistocene strikingly greater in mountains than in lowlands)

Forderer, M. & M.R. Langer (2016)- Five new species and one new genus of recent miliolid foraminifera from Raja Ampat (West Papua, Indonesia). PeerJ 4:e2157; DOI 10.7717/peerj.2157, p. 1-20.
(online at: www.ncbi.nlm.nih.gov/pmc/articles/PMC4924127/pdf/peerj-04-2157.pdf)
(Shallow waters W of Waigeo Island with highly diverse assemblages of 455 species of benthic foraminifera (249 miliolid species). With new genus (Dentoplanispirinella) and 5 new species of miliolids (D. occulta, Miliolinella moia, M. undina, Triloculina kawea, Siphonaperta hallocki). New species relatively rare)

Forderer, M. & M.R. Langer (2018)- Atlas of benthic foraminifera from coral reefs of the Raja Ampat Archipelago (Irian Jaya, Indonesia). Micropaleontology 64, 1-2, p. 1-170.
(Exceptionally rich and diverse shallow marine benthic foram assemblages in Raja Ampat islands, W of Waigeo/ Batanta islands: 421 species, with miliolids highest species number. Incl. 35 species of symbiont-bearing larger foraminifera, amongst highest in modern oceans)

Forderer, M. & M.R. Langer (2019)- Exceptionally species-rich assemblages of modern larger benthic foraminifera from nearshore reefs in northern Palawan (Philippines). Revue de Micropaleontologie 65, 9, 100387, p. 1-25.
(44 larger foraminifera morphospecies from shallow nearshore habitats in N Palawan, among the highest reported anywhere (in Coral Triangle hotspot of biodiversity). Heterostegina depressa and Calcarina mayori most widely distributed taxa)

Forderer, M., D. Rodder & M.R. Langer (2018)- Patterns of species richness and the center of diversity in modern Indo-Pacifc larger foraminifera. Nature Scientific Reports 8, 8189, p. 1-9.

(Species richness maps for Indo-Pacific larger foraminifera)

Forel, M.B. (2021)- Recent ostracods (Crustacea) from the southwestern coast of Peninsular Thailand (Satun Province), Andaman Sea. Revue de Micropaleontologie 72, 100526, p. 1-15.
(35 species of ostracods from shallow (<1.5 m) embayment near Mu Koh Phetra National Park, SW Peninsular Thailand, Andaman Sea. Most species well-known from Indo-Pacific area)

Frerichs, W.E. (1967)- Distribution and ecology of benthonic foraminifera in the sediments of the Andaman Sea. Ph.D. Thesis University Southern California, Los Angeles, p. 1-269.
(Recent foraminifera from seafloor samples across Andaman Sea, between 13-3778m depth. Number of forams increases with depth to 1800m; below this affected by dissolution of calcareous foraminifera. Planktonic number increases with depth and distance from shore. Planktonic assemblages from shelf sediments have globose chambers (Globigerina, Globigerinoides, Globigerinita); in bathyal deposits common Globorotalia and Sphaeroidinella. Radiolarian number increases with depth; not significant above middle bathyal depths. Benthic foraminifera five faunal provinces. Etc.)

Frerichs, W.E. (1970)- Distribution and ecology of benthonic foraminifera in the sediments of the Andaman Sea. Contr. Cushman Foundation Foraminiferal Research 21, 4, p. 123-147.
(online at: https://cushmanfoundation.allenpress.com/portals/_default/files/pubarchive/CCFFR/21ccffr4.pdf)

(In Andaman Sea shelf faunas characterized by species of Ammonia, Asterorotalia and Pseudorotalia. Upper bathyal faunas characterized by first appearance of Bolivina robusta. Change in ornamentation of Uvigerina at upper-middle bathyal boundary: costate species in outer shelf-upper bathyal; hispid species (U. auberiana) below 600m. Lower bathyal microfaunas calcareous forams dissolved, characterized by arenaceous Glomospira charoides and Karreriella apicularis. Etc.)

Frerichs, W.E. (1971)- Planktonic foraminifera in the sediments of the Andaman Sea. J. Foraminiferal Research 1, p. 1-14.
(Distribution of Recent planktonic foraminifera in sediments of Andaman Sea controlled by surface salinity, water depth, diagenesis and topography. Large volumes of fresh water in N Andaman Sea result in lowering of surface salinity and exclusion of planktonic forams. Depth zonation: Sphaeroidinella and some Globorotalia species indicative of bathyal depths)

Fujita, K. (2006)- Identification of coral reef environments based on foraminiferal death assemblages from Ishigaki Island, Okinawa, Japan. Proc. 10th International Coral Reef Symposium, Okinawa 2004, p. 528-535.
(Reef-flat foraminiferal assemblages characterized by dominant Calcarinidae, whereas fore-reef foraminiferal assemblages are characterized by various dominant species)

Fujita, K. & S. Kato (2011)- Distribution of gravel-sized empty tests of large benthic foraminifers as practical depositional indicators in tropical reef and shelf carbonate environments. Facies 57, 4, p. 525-541.
(Depth and spatial distributions of Large Benthic Forams in 39 surface sediment samples from W coast of Miyako Island (Ryukyu Islands, NW Pacific))

Fujita, K., Y. Osawa, H. Kayanne, Y. Ide & H. Yamano (2009)- Distribution and sediment production of large benthic foraminifers on reef flats of the Majuro Atoll, Marshall Islands. Coral Reefs 28, p. 29-45.
(Estimates of sediment production by Large Benthic Forams, mainly Calcarina and Amphistegina, on reef flats of Pacific atolls. Both live attached to seagrass/algae and most abundant on ocean reef flat (ORF) and in inter-island channel near windward, sparsely populated islands. Calcarina density higher on windward sides)

Fujita, K., M. Otomaru, P. Lopati, T. Hosono & H. Kayanne (2016)- Shell productivity of the large benthic foraminifer *Baculogypsina sphaerulata*, based on the population dynamics in a tropical reef environment. Coral Reefs 35, p. 317–326

Fujita, K., H. Shimoji & K. Nagai (2006)- Paleoenvironmental interpretations of Quaternary reef deposits based on comparisons of 10 selected modern and fossil larger foraminifera from the Ryukyu Islands, Japan. Island Arc 15, 4, p. 420-436.

Girard, E.B., Estradivari, S. Ferse, R.A.-Rappe, J. Jompa & W. Renema (2022)- Dynamics of large benthic foraminiferal assemblages: A tool to foreshadow reef degradation? Science of the Total Environment 811, 151396, p. 1-11.
(online at: https://www.sciencedirect.com/science/article/pii/S0048969721064743)
(In Spermonde Archipelago (S Sulawesi) temporal shift was observed in foraminiferal assemblages from coral-dominated (e.g, Amphistegina lobifera, Calcarina spengleri, Heterostegina depressa) to fleshy algae dominated (e.g. Neorotalia gaimardi, C. mayori))

Glenn, E.C. (1989)- Foraminifera and associated sedimentary constituents in Holocene and Miocene reefs of the Philippines and Indonesia. Ph.D. Thesis, University of Houston, p. 1-665. *(Unpublished)*

Glenn, E.C., J.W. McManus, P.M. Alino, L. Talaue, P. Alino & V. Banzon (1981)- Distributions of live foraminifers on a portion of Apo Reef, Mindoro, Philippines. Proc. 4th International Coral Reef Symposium, Manila 1981, 2, p. 775-780.
(Apo reef W of Mindoro in S China Sea with 10 physiographic zones. Sediment pockets in reef wall with Amphistegina lessonii, Marginopora vertebralis. Deep lagoon with Elphidium, Sorites marginalis, Peneroplis. Reef flat with Calcarina spp., etc.)

Glenn-Sullivan, E.C. & I. Evans (2001)- The effects of time-averaging and taphonomy on the identification of reefal sub-environments using larger foraminifera: Apo Reef, Mindoro, Philippines. Palaios 16, 4, p. 399-408.
(Foraminifera ~40% of sediment at small, isolated Apo Reef. Comparisons of live and dead assemblages show time-averaged assemblages, the product of taphonomic processes, more effective in delineating reefal sub-environments than do live assemblages. Robust calcarinids are in shallow seaward zones; free-living miliolids and small rotaliines in leeward zones. Planktonics and large thin rotaliines in fore reef)

Goeting, S., A. Briguglio, W. Eder, J. Hohenegger, A. Roslim & L. Kocsis (2018)- Depth distribution of modern larger benthic foraminifera offshore Brunei Darussalam. Micropaleontology 64, 4, p. 299-316.
(Recent larger foram distribution at 6 sites in 8-35m water off Brunei Darussalam (mainly sandy patches near shipwrecks, in area of mud-dominated seafloor without larger forams). High diversity assemblages, 16 species. Shallowest samples dominated by Calcarina defrancei and Neorotalia calcar, deepest samples by Amphistegina radiata, Operculina ammonoides and Calcarina mayori. Alveolinella quoii around 30m)

Goeting, S., V. Cosovic; A. Benedetti, F. Fiorini, L. Kocsis, A. Roslim & A. Briguglio (2022)- Diversity and depth distribution of modern benthic foraminifera offshore Brunei Darussalam. J. Foraminiferal Research 52, 3, p. 160-178.
(231 species of foraminifera identified from 8-63 m water depth off Brunei. Most abundant foraminiferal groups from reef and wreck samples are larger benthic foraminifera: especially Calcarinidae and Amphisteginidae. In muddier sites mainly smaller benthic forams with Pseudorotalia and Asterorotalia)

Goeting, S., F. Fiorini, A. Benedetti, L. Kocsis, A. Roslim, N. Zaini & A. Briguglio (2021)- Catalogue of modern smaller benthic foraminifera from offshore Brunei Darussalam. Palaeontographica, A. Palaeozoology-Stratigraphy, 318, 5-6, p. 129-223.
(207 species/ 88 genera pf modern smaller benthic foraminifera from 17 sites off Brunei, including proximal reef, muddy to sandy seafloors near sunken wrecks and two transects in muddy environments between 8-63 m)

Goeting, S., H.C. Lee, L. Kocsis, C. Baumgartner-Mora & D.J. Marshall (2023)- Diversity and distribution of the benthic foraminifera on the Brunei Shelf (Northwest Borneo): effect of seawater depth. Diversity 15, 8, 937, p. 1-23.
(online at: https://www.mdpi.com/1424-2818/15/8/937)
(Benthic forminifera from samples on Brunei shelf between 10m and shelf edge at-200m depth, with 99 species, belonging to 56 genera. General increase in species richness with increasing depth along Brunei shelf, with greatest richness observed at depth of 144 m. Excellent plates)

Gorog, A.J., M.H. Sinaga & M.D. Engstrom (2004)- Vicariance or dispersal? Historical biogeography of three Sunda shelf murine rodents (*Maxomys surifer, Leopoldamys sabanus* and *Maxomys whiteheadi*). Biological J. Linnean Society, London, 81, p. 91-109.
(online at: https://academic.oup.com/biolinnean/article/81/1/91/2639894)
(DNA tests of three rain-forest-restricted murine rodents of Borneo, Sumatra, Java, Malay Peninsula and Indochina do not support hypothesis of migrations enabled by Late Pleistocene land bridges/ rainforest corridors, but suggest older history of divergent evolution since Pliocene fragmentation of Sunda block)

(Modern intertidal foraminifera in mangrove-lined microtidal distributary of Barron River Delta (Queensland): (1) saltmarsh: Trochammina inflata assemblage; (2) regularly inundated tidal flat: dominated by Ammonia beccarii; (3a) high tidal flat: >70% Ammonia beccarii and low diversity, and (3b) low tidal flat: 55-65% Ammonia beccarii and diverse small allochthonous species transported into estuary from shelf)

Hayward, B.W. & S. Kawagata (2005)- Extinct foraminifera figured in Brady's Challenger Report. J. Micropalaeontology 24, 2, p. 171-175.
(online at: https://www.j-micropalaeontol.net/24/171/2005/jm-24-171-2005.pdf)
(Brady's classic 1884 monograph on Recent foraminifera from Challenger Expedition samples contains 18 species known to become extinct in M Pleistocene, between 1.2- 0.6 Ma (mainly elongate, benthic foraminifera like Pleurostomella, Stilostomella, Orthomorphina, etc.). Majority (14 species) from two stations off Kei Islands, Banda Sea (191A, 192). Station 192 (~250m depth) is considerably shallower than established fossil bathymetric ranges of extinct species, suggesting tectonic uplift and Pleistocene deposits exposed on seafloor)

Hayward, B.W., S. Kawagata, H.R. Grenfell, A.T. Sabaa & T. O'Neill (2007)- Last global extinction in the deep sea during the mid-Pleistocene climate transition. Paleoceanography 22, PA3103, p. 1-14.
(20% of cosmopolitan deep-sea benthic foraminifera extinct during late Pliocene-M Pleistocene, with peak of extinctions during M Pleistocene Climate Transition (1.2-0.55 Ma). Family Stilostomellidae (30 species) wiped out, Pleurostomellidae (9 species) decimated. Pulsed declines in abundance, earlier in deepst water sites. Tied to demise of microbial food source due to increased cold and oxygenation of S-sourced deep water masses during major late Pliocene and E Pleistocene glacials)

(Rel. low diversity recent foraminifera assemblages in shallow marine Jakarta Bay, dominated by Pseudoratalia schroeteriana, Asterorotalia pulchella, Elphidium batavum, Operculina complanata, Quinqueloculina. Highest diversity in NW part of bay. Pseudorotia most common in muddy substrates in SE, Baculogypsinoides and miliolids mainly in NW, away from delta muds)

Hofker, J. (1978)- Biological results of the Snellius Expedition XXX. The foraminifera collected in 1929 and 1930 in the eastern part of the Indonesian Archipelago. Zoologische Verhandelingen, Rijksmuseum Natuurlijke Historie Leiden 161, p. 1-69.
(online at: www.repository.naturalis.nl/document/155300)
(462 species of foraminifera from 78 sea bottom samples at depths 85- 5138m, collected by 1929-1930 Snellius Expedition to East Indonesia, and a few other shallow marine samples)

Hohenegger, J. (1994)- Distribution of living larger foraminifera NW of Sesoko-Jima, Okinawa, Japan. Marine Ecology 15, p. 291-334.
(Living larger foraminifer restricted to photic zone. Peneroplids in shallow-water from intertidal (common Peneroplis) to 40m (Dendritina, sandy substrates). Soritids subtidal, from reef moat down to 60m. Amphisorus and Marginopora common down to 3 m, Parasorites in deeper parts of reef slope. Alveolinella in upper 40m of reef slope. Amphisteginids in entire photic zone, with test flattening with increasing depth. Calcarinids cling to firm substrates. Baculogypsina restricted to high energy reef flat regions. Calcarina similar facies, extending to fore reefs down to 8m. Baculogypsinoides dominant calcarinid genus from 30-70m depth. Heterostegina prefers hard substrates on reef slope. Operculina frequent in deeper part, independent of substrates. Sandy bottoms from 30-60m inhabited by Nummulites (Operculina) venosus. Cycloclypeus restricted to fore reef areas below 50m down to base of photic zone)

Hohenegger, J., E. Yordanova & A. Hatta (2000)- Remarks on West Pacific Nummulitidae (Foraminifera). J. Foraminiferal Research 30, p. 3-28.

(Operculina, Planostegina, Cycloclypeus and Heterostegina from W Pacific. Heterostegina depressa broad range in light intensities and is protected against irradiation by thick tests and cryptic life mode near surface. Test construction enables life under strong hydrodynamic regimes. Lives firmly attached to hard substrates, thus counteracting transportation by water movement. Nummulites venosus lives exclusively on coarse sand and avoids high sediment movement, starting distribution beneath fair weather wave base. Cycloclypeus carpenteri easily transported due to thin, plate-like form. Upper distribution limit correlates with storm wave base, below 50m. Lower distribution limit depends on light intensity and is near base photic zone)

Hohenegger, J., E.K. Yordanova, Y. Nakano & F.Tatzreiter (1999)- Habitats of larger foraminifera on the upper reef slope of Sesoko Island, Okinawa, Japan. Mar. Micropal. 36, p. 109-168.
(Peneroplis common on reef flat, hardgrounds down to 30m. Dendritina on sandy bottoms avoids uppermost slope, found down to 50m. Alveolinella similar distribution, common on hard bottom. Parasorites restricted to sandy substrates, 20-80m. Sorites and Amphisorus firm substrates between reef edge and 50m. Amphistegina species prefer hardgrounds, A. radiata also common on sand. Calcarinids withstand high energy, abundant on firm substrates close to reef edge. Baculogypsinoides deeper slope, sandy bottom, avoids shallowest parts. Hard substrates settled by Heterostegina down to 80m, occasionally on sandy bottoms. Nummulites on sands between 20- 70m. Operculina, starting at 20m, sandy substrates, rare individuals on rubble)

(Samples from 8-65 water depth in Avatiu and Avarua channels of Rarotonga Island, S Pacific. Foraminifera mainly Cymbaloporetta bradyi, Borelis schlumbergeri, Heterostegina depressa, Peneroplis pertusus, Planorbulinella larvata, Siphogenerina raphanus, Sorites marginalis, Reussella simplex, Spirillina vivipara, Rosalina globularis, Amphistegina radiata, Planispirinella exigua and small miliolids)

Hughes, G.W. (2008)- Recent brackish Foraminifera and Thecamoebae from Sedili River, West Malaysia. Malaysia. In: M.A. Kaminski & R. Coccioni (eds.) Proc. 7th Int. Workshop on agglutinated foraminifera, Grzybowski Foundation Special Publ. 13, p. 41-45.

(Sedili River of S Malay Peninsula enters S China Sea through wide estuary. Lower estuarine, mangrove-fringed regime with normal marine salinity (34 ppt) has mixed calcareous-agglutinated autochthonous foraminiferal assemblage with Trochammina, Tiphotrocha comprimata, Haplophragmoides and Ammobaculites and surge-transported inner neritic calcareous benthic forams (Asterorotalia, Cellanthus, Triloculina, Ammonia, Elphidium, etc.) and rare planktonics. Estuarine, mangrove-fringed regime upstream of lower estuarine contains diverse agglutinated foraminiferal assemblages dominated by Trochammina spp., Tiphotrocha, Cribrostomoides and Ammobaculites. Upper estuarine, freshwater-slightly brackish Pandanu- grass-fringed tidal regime with low diversity agglutinated foram assemblages dominated by Miliammina fusca and Spirolocammina sp. Upstream freshwater areas of Nipa palm and grass-fringed river banks barren of foraminifera. Thecamoebae include Difflugia oblonga, Cucurbitella tricuspis and Nebela colaris)

Hunt, C.O., D.D. Gilbertson & G. Rushworth (2012)- A 50,000-year record of Late Pleistocene tropical vegetation and human impact in lowland Borneo. Quaternary Science Reviews 37, p. 61-80.
(Palynology from exposures in Great Cave of Niah, Sarawak, spanning ~52,000-5000 BP records climate-driven vegetation changes. Interstadials (interglacial periods) are marked by lowland forest, stadials by taxa from open environments or, as at the Last Glacial Maximum by disturbed open forest. Glacial stadials also characterised by taxa now restricted to 1000-1600 m above sea level, suggesting temperature declines of ~ 7–9 °C relative to todayt. Biomass burning appears associated with earliest human activity in cave)

(Review and bibliography of over 100 papers dealing with shallow marine and coastal Recent foraminifera)

Khustina, Y.C., D.D. Solihin & N.T.M. Pratiwi (2014)- Morphological identification and diversity analysis of fossil diatoms from diatomite Sangiran Central Java Indonesia. Jurnal Biologi Indonesia 10, 2, p. 247-258.
(online at: https://e-journal.biologi.lipi.go.id/index.php/jurnal_biologi_indonesia/article/view/2105)
(Pleistocene lower, middle and upper diatomites in Sangiran with 50 species identified. Highest diversity in lower diatomite (34 species, mixed marine and freshwater; dominated by Coscinodiscus kutzingi). Middle diatomite dominated by Fragilaria and Coscinodiscus lineatus. Upper diatomite mainly Fragilaria, Cyclotella and Coscinodiscus spp. Gradual changes reflect change from marine to freshwater environment)

Kleijne, A. (1990)- Distribution and malformation of extant calcareous nannoplankton in the Indonesian Seas. Marine Micropaleontology 16, p. 293-316.
(Calcareous nannoplankton distribution in 202 samples from Snellius-II Expedition in Banda Sea and adjacent seas. 36 living species recorded; most common Gephyrocapsa oceanica, Umbellosphaera irregularis, Emiliania huxleyi and U. sibogae. Coccolithophorids present, but devoid of coccoliths during NW monsoon, suggesting low salinity and nutrient depletion of surface waters restrict coccolith formation, since normal coccoliths do develop during SE monsoon when upwelling causes nutrient enrichment and normal salinity)

Kob, M.R.C. (1993)- Late Quaternary nannofossils from offshore Sabah, northwest Borneo. In: T. Thanasuthipitak (ed.) Proc. International Symposium Biostratigraphy of mainland Southeast Asia: facies & paleontology (BIOSEA), Chiang Mai 1993, Chiang Mai University, 2, p. 261-281.
(online at: http://library.dmr.go.th/Document/Proceedings-Yearbooks/M_1/1993/2298_2 ...)
(late Pleistocene- Recent calcareous nannofossils from 13m thick core KL139 in ~2700m water depth of Sabah Trough. Emiliana huxleyi, Gephyrocapsa oceanica and 'small Gephyrocapsa' >50% of total assemblages. Four zones: deeper zone C (Late Pleistocene Last Glacial Maximum?) with peak 'small Gephyrocapsa' represents rel. cool period, youngest zone A with peak G. oceanica rel. warm)

Koba, M. (1978)- Distribution and environment of Recent *Cycloclypeus*. Science Reports Tohuku University, ser. 7, 28, p. 283-311.
(online at: http://ir.library.tohoku.ac.jp/re/bitstream/10097/45065/1/AA0045945078466.pdf)
(Tropical larger foram Cycloclypeus widely distributed in Recent of Indo-Pacific oceanic region. Common on outer reef slopes, and confined by 200m isobath. Not present in pelagic environments, reef banks, lagoons or bays. In Recent samples found between 32-1419m depth, but clear abundance peak around 90m)

Langer, M.R. (1992)- New Recent foraminiferal genera and species from the lagoon at Madang, Papua New Guinea. J. Micropalaeontology 11, 1, p. 85-93.
(online at: https://www.j-micropalaeontol.net/11/85/1992/jm-11-85-1992.pdf)
(Samples from shallow water (0-55m) fore- and back-reef environments at Madang lagoon with larger foraminifera (Assilina spp., Heterostegina depressa, Alveolinella quoyi, Sorites spp., Amphisorus hemprichii, Marginopora vertebralis). Two new genera (Pseudolachlanella) and eight new species of benthic foraminifera)

Langer, M.R. (1995)- Oxygen and carbon isotopic composition of Recent larger and smaller foraminifera from the Madang Lagoon (Papua New Guinea). Marine Micropaleontology 26, p. 215-221.

(General trend in Recent large benthic foraminifera (Operculina, Heterostegina, Sorites, Marginopora, Alveolinella) from Madang Lagoon of depletion in heavier C and O isotopes with depth appears to be depth- and light-dependant)

Langer, M.R. & L. Hottinger (2000)- Biogeography of selected 'larger' foraminifera. Micropaleontology 46, Suppl. 1, Advances in the biology of foraminifera, p. 105-126.
(Global distributions of Recent larger foraminifera species. Main provinces: (1) Central Pacific with Baculogypsinoides spinosus, Schlumbergerella floresiana, Operculina heterosteginoides, Pseudorotalia indopacifica; (2) Indo-Pacific with Marginopora vertebralis, Alveolinella quoyii, Amphistegina radiata, Calcarina spp., Nummulites venosus and Cycloclypeus carpenteri; (3) W Indian Ocean and (4) Caribbean)

Langer, M.R. & J.H. Lipps (2003)- Foraminiferal distribution and diversity, Madang reef and lagoon, Papua New Guinea. Coral Reefs 22, p. 143-154.
(Benthic foram distribution shows four clusters in Madang lagoon at NE coast of PNG)

Lei, Y. & T. Li (2016)- Atlas of benthic foraminifera from China Seas, the Bohai Sea and the Yellow Sea. IUP Science Press, Beijing, Springer, p. 1-399.
(Descriptions of 183 species of mainly shallow marine foraminifera from northern South China Sea)

Lelono, E.B. (2006)- Pleistocene palynology of East Java. Lemigas Scientific Contributions 29, 3, p. 3-14.
(online at: https://journal.lemigas.esdm.go.id/index.php/SCOG/article/view/1027)
(Study of Pleistocene palynology in 3 unnamed wells in NE Java basin. Base Pleistocene characterised by index pollen of Dacrycarpidites australiensis and abundant grass pollen of Monoporites annulatus in the absence of spore of Stenochlaenidites papuanus. Interpretation supported by occurrence of nannoplankton Gephyrocapsa eocenica (NN19). Benthic zone lower NB1 (equivalent to E Pleistocene planktonic foram zone N22, based on appearance of Asterorotalia gaimardii and Pseudorotalia schroeteriana in absence of Asterorotalia gaimardii inermis, Pseudorotalia schroeteriana angusta, P. alveiformis, Asanoina globosa and Ammonia ikebei)

Lelono, E.B. (2018)- Dry climate expansion in the Pleistocene of Indonesia as recorded in its pollen assemblage. Scientific Contributions Oil and Gas (SCOG), Lemigas, Jakarta, 41, 1, p. 17-27.
(online at: http://journal.lemigas.esdm.go.id/ojs/index.php/SCOG/article/download/69/pdf)
(Pleistocene characterised by glacial and interglacial periods. In Indonesia reflected in dry/cool (abundant Gramineae grass pollen) and wet/warm climates (increases of coastal and mangrove palynomorphs). Quantitative palynology shows Pleistocene in E Java wells characterised by abundant Monoporites annulatus grass pollen, corresponding to glacial-period expansion of savanna vegetation. Abundant charred Gramineae cuticles reflect burning grass. In N Papua wells repetition of dry/ wet conditions or low/ high sea levels)

LeRoy, L.W. (1938)- A preliminary study of the microfaunal facies along a traverse across Peper Bay, West coast of Java. De Ingenieur in Nederlandsch-Indie (IV) 5, 8, p. IV.130- IV.133.
(online at: https://www.stichtingblauwelijn.nl/assets/files/1938-08.pdf)
(Recent foraminifera off West coast of Java, SW of Labuan (deepest sample 32m). Three assemblages (1) Haplophragmoides- Haplophragmium facies (semi-brackish), (2) Operculina- Ozawaia facies (18-32m, marine) and (3) Dendritina-Aveolinella facies (7-26m; also Rotalia calcar, Calcarina spengleri, Marginopora, etc.))

(online at: http://digitallibrary.usc.edu/cdm/ref/collection/p15799coll30/id/107855)
(Mainly on distribution of Baculogypsina and Tinoporus in western tropical Pacific)

Lessard, R.H. (1980)- Distribution patterns of intertidal and shallow water foraminifera of the tropical Pacific Ocean. Cushman Foundation Foraminiferal Research, Special Publ. 19, p. 40-58.
(online at: https://business.cushmanfoundation.org/ap/CloudFile/Download/rJDJ8V5P

(Recent foraminifera from intertidal and shallow-water sediment samples along two major sections across islands of tropical Pacific Ocean, dominated by Tinoporus, Baculogypsina, Atnphistegina, Marginopora and Heterostegina. With discussions on possible dispersal mechanisms. No distrubution maps)

Li, Z., Y. Saito, L. Mao, T. Tamura, Z. Li, B. Song, Y. Zhang, A. Lu, S. Sieng & J. Li (2012)- Mid-Holocene mangrove succession and its response to sea-level change in the upper Mekong River delta, Cambodia. Quaternary Research 78, 2, p. 386-399.
(Cores from upper Mekong River delta in Cambodia record transgressive sequence from floodplain freshwater marsh to tidal flat (~9.4- 6.3 ka), overlain by mangrove. At decelerated sea-level rise at ~8.3 ka pioneer (high-salinity tolerant) mangrove species Sonneratia alba and Sonneratia caseolaris appeared, then was replaced by regressive mangrove succession of increasing Rhizophora apiculata and Bruguiera spp.)

Ling, H.Y. & W.A. Anikouchine (1967)- Some spumellarian radiolaria from the Java, Philippines and Mariana trenches. Journal of Paleontology 41, 6, p. 1481-1491.
(Eight species of five genera of patagium-bearing and morphologically closely related spumellarian Radiolaria in three sediment cores from Java, Philippine, and Mariana Trenches. Java Trench samples from pelagic ooze in core from 3380m water depth off S Sumatra, with Euchitonia spp., Hymeniastrum, Dictyocorine and Rhopalodictyum. Also locally common diatiom Ethmodiscus rex)

Lipps, J.A. & K.P. Severin (1985)- *Alveolinella quoyi*, a living fusiform foraminifera, at Motupore Island, Papua New Guinea. Science in New Guinea (University of PNG, Port Moresby) 11, p. 126-137.
(Living species of Alveolinella quoyi in water depths of 3-12m, mainly on algae-covered coral rubble and around bases of living coral heads in rel. sheltered areas. Dead tests scattered over wider bathymetric range. Virtually absent on back-reef flats)

Lobegeier, M.K. (2002)- Benthic foraminifera of the family Calcarinidae from Green Island Reef, Great Barrier Reef Province. J. Foraminiferal Research 32, 3, p. 201-216.
(Three epiphytic calcarinid species on Great Barrier Reef and limited to W Indo-Pacific (absent from Indian Ocean and E of 170°W). Calcarina spengleri (=hispida) dominant and common in shallow water on reef flat. Calcarina mayori smaller and dominates in deeper water off reef flat. Baculogypsina sphaerulata is shallow water high-energy species. Best preserved Calcarina at Green Island Reef in windward shoals)

Li, B.H., X.Y. Wang, Z.M. Jian, P.X. Wang (2009)- Sea surface environment inferred from planktonic foraminifera in the southern South China Sea since the last glacial period. Palaeoworld 18, p. 23-33.
(Planktonic foraminifera from Site 17964 in southern S China Sea (SCS) show higher % warm-water species in Holocene, while temperate-water species increase during last glacial period. Pulleniatina obliquiloculata more common during glacial period. Orbulina universa test size larger than those in Indian and Atlantic Oceans, indicating warmer and less saline surface water in Equatorial- tropical W Pacific. Diameter and shell porosity of O. universa increased from last glacial to Holocene)

Lirdwitayaprasit, T. (1997)- Distribution of dinoflagellate cysts in the surface sediment of the South China Sea, Area I: Gulf of Thailand and East Coast of Peninsular Malaysia. Proc. 1st Techn. Seminar Marine fishery resource survey in the South China Sea, SE Asia Fisheries Development Centre (SEAFDEC), Training Dept., Thailand, S4/SB7, p. 294-309.

(Benthic foraminifera from Indonesian waters have been studied since the Challenger Expedition in 1876. To date, 1164 species of Recent benthic foraminifera documented here, belonging to 448 genera. Numerous instances of taxonomic misnaming)

Pudjoarinto, A. (1999)- Palynological evidence for environmental change in Dieng Highland. Indonesian J. Geography 31, 77-78, p. 11-24.
(Palynology of 18m core from small lake in Dieng Plateau, C Java. Montane forest assemblages record climate changes)

Putra, P.S. & S.H. Nugroho (2020)- Holocene climate dynamics in Sumba Strait, Indonesia: a preliminary evidence from high resolution geochemical records and planktonic foraminifera. Studia Quaternaria 37, 2, p. 91-99.
(online at: https://journals.pan.pl/Content/116874/PDF/4_Putra.pdf)
(Planktonic foraminifera in 243cm drop core ST14 in 1283m water depth in Sumba Strait. Base Holocene determined from first occurrence of Globigerina calida calida at 156 cm. Six Holocene climate zones (warm-humid versus cold-dry episodes) identified. Cool water Globigerina bulloides more abundant in Pleistocene than in Holocene sediment. Globorotalia menardii, Gr. tumida, Pulleniatina obliquiloculata peaks in warm humid zones. Etc.)

Rai, A.K. & V.B. Singh (2001)- Late Neogene deep-sea benthic foraminifera at ODP Site 762B, eastern Indian Ocean: diversity trends and palaeoceanography. Palaeogeogr. Palaeoclim. Palaeoecology 173, p. 1-8.
(Pliocene-Pleistocene deep sea benthic foraminifera from ODP Site 762B off Exmouth Plateau. Species diversity inverse relationship with abundance of Uvigerina proboscidea and precentage infaunal taxa))

Rai, A.K. & V.B. Singh (2012)- Response of eastern Indian Ocean (ODP Site 762B) benthic foraminiferal assemblages to the closure of the Indonesian seaway. Oceanologia 54, 3, p. 449-472.
(Pliocene-Pleistocene deep sea benthic foraminifera from ODP Site 762B off Exmouth Plateau in E Indian Ocean. Diverse fauna in E Pliocene (>3.5 Ma) relatively oligotrophic and warm bottom water conditions. At beginning of Late Pliocene (i.e. $\sim 3 \pm 0.5$ Ma) increase in Uvigerina proboscidea, infaunal taxa and high productivity taxa and decline in faunal diversity suggest development of pronounced upwelling. Reduced inflow of warm and oligotrophic water masses from SW Pacific to E Indian Ocean due to effective closure of Indonesian seaway increased surface water productivity. Closing of Indonesian seaway in Late Pliocene also responsible for cessation of warm, S-flowing Leeuwin Current)

Rajshekhar, C. (2013)- The Late Holocene foraminifera from Andaman Islands, Andaman Sea, Bay of Bengal. In: K. Venkataraman et al. (eds.) Ecology and conservation of tropical marine faunal communities, Springer Verlag, p. 3-18.
(S Andaman Island three distinct environments: rocky shore with Elpidium, Amphistegina; (2) sandy shore with common Calcarina and (3) intertidal muddy region with Trochammina inflata is common in intertidal clays)

Ramlan, Omar & Noraswana Nor Faiz (2014)- Distribution of recent ostracoda in offshore sediment of the South China Sea. Pertanika J. Science and Technology 22, 2, p. 433-444.
(online at: http://www.pertanika.upm.edu.my/pjst/browse/archives?article=JST-0379-2012)
(30 sediment samples in S China Sea off eastern Malay Penisula contain 79 species of ostracods. Dominant species Foveoleberis cypraeoides. Two faunal assemblages: shallow water (<50m) (Hemikrithe orientalis, Neomonoceratina iniqua, Stigmatocythere indica, Cytherelloidea leroyi and Neocytheretta snellii) and deep water (>50m) (Paracypris sp., Alataconcha pterogona, Bythocytheropteron alatum, Keijella paucipunctata and Actinocythereis scutigera).

Rao, N.R., M. Jayaprakash & P.M. Velmurugan (2013)- The ecology of *Asterorotalia trispinosa* (Thalmann, 1933)- new insights from Muthupet Lagoon, Southeast Coast of India. J. Foraminiferal Research 43, p. 14-20.
(Asterorotalia trispinosa dominates sparse foraminiferal assemblage of shallow, mud-dominated Muthupet Lagoon on SE coast of India, where salinities are slightly lower than normal marine)

Rasheed, D.A. (1968)- Distribution of foraminifera in the Coral Sea, South of Papua, New Guinea. J. of the Madras University B37-38, p. 73-80.

Rasheed, D.A. (1970)- Some Recent arenaceous foraminifera from the Coral Sea. south of Papua, New Guinea. J. of the Madras University B39-40, p. 41-58.

Rasheed, D.A. (1970)- Some recent calcareous foraminifera belonging to the families Peneroplidae. Alveolinellidae, Lagenidae and Polymorphinidae from the Coral Ssea, South of Papua (New Guinea). J. of the Madras University B39-40, p. 77-110.

Rasheed, D.A. (1970)- Some calcareous foraminifera belonging to the families Rotaiiidae, Cymboloporidae, Anomalinidae, Calcarinidae, Globigerinidae and Bulinidae from the Coral Sea, South of Papua (New Guinea). J. of the Madras University B 39-40, p. 150-201.

Rasheed, D.A. (1971)- Some foraminifera belonging to Miliolidae and Ophthalmidiidae from the Coral Sea, South of Papua (New Guinea), Part II. J. of the Madras University B37-38, p. 150-201.

Rathburn, A.E. & B.H. Corliss (1994)- The ecology of living (stained) deep-sea benthic foraminifera from the Sulu Sea. Paleoceanography 9, p. 87-150.
(Deep-sea benthic foraminifera distibution in 8 box cores from 510-4515 m in thermospheric (>10°C) Sulu Sea. Site 510m dominated by Cibicidoides, Uvigerina, and Bolivina. 1005m core: mainly Siphonina Cibicidoides, Uvigerina. 2000m cores: Cibicidoides, Gyroidinoides, and Oridorsalis. 3000 and 4000m cores: Cibicidoides bradyi and Oridorsalis umbonatus dominant. Infaunal Valvulineria mexicana in sediments of 4515m core. Low bottom water oxygen values do not necessarily yield 'low-oxygen taxa' like Bolivina, Uvigerina, Chilostomella, Bulimina and Globobulimina)

Rathburn, A.E., B.H. Corliss, K.D. Tappa & K.C. Lohmann (1996)- Comparisons of the ecology and stable isotopic compositions of living (stained) benthic foraminifera from the Sulu and South China Seas. Deep Sea Research 1, 43, 10, p. 1617-1646.
(Significant differences between living deep-sea benthic foraminifera in thermospheric (>10°C) environments of Sulu Sea and psychrospheric (<10°C) conditions in S China Sea. Gavelinopsis, Bolivinopsis, Astrononion, Osangularia and Ceratobulimina common taxa in S China Sea, but rare in Sulu Sea. Siphonina and Valvulineria dominant genera at certain depths in Sulu Sea, but rare in S China Sea. Differences result from large differences of bottom-water temperatures)

Rathburn, A.E. & Q. Miao (1995)- The taphonomy of deep-sea benthic foraminifera: comparisons of living and dead assemblages from box and gravity cores taken in the Sulu Sea. Marine Micropaleontology 25, p. 127-149.
(Benthic foraminifera from 500- 4000m water in Sulu Sea. Bolivina, Bulimina, Globobulimina, Chilostomella and Uvigerina most abundant <1500m, but rel. rare in deeper water. Dominant taxa below 2000m Cibicidoides bradyi and Oridorsalis umbonatus)

Razak, N.S.A., H. Shaari, F.I. Minhat, E.H. Ariffin, F. Shariful, S. Yang, R. Suriadi & H.M. Sharif (2023)- Benthic foraminifera as environmental indicators in the lagoon and mangrove environments of Langkawi, Malaysia. Marine Geology 462, 107095, p. 1-11.
(Foraminiferal distribution in the surface sediments of Sungai Kilim in Kilim Geoforest Park, Pulau Langkawi, NW Malaysia. Twenty-eight genera of benthic foraminifera from surface samples. Elphidium (13-83%) most

abundant in mangrove and lagoon environments.Other common genera Trochaminna, Ammotium, Ammobaculites and Haplophragmoides)

Reeves, J.M. (2004)- The use of ostracoda in the palaeoenvironmental reconstruction of the Gulf of Carpenteria, Australia, from the last interglacial to present. Ph.D. Thesis University of Wollongong, p. 1-447.
(online at: http://ro.uow.edu.au/cgi/viewcontent.cgi?filename=0&article=1211&context=theses&type=additional)

Reeves, J.M., A.R. Chivas, A. Garcia & P. De Deckker (2007)- Palaeoenvironmental change in the Gulf of Carpentaria (Australia) since the last interglacial based on Ostracoda. Palaeogeogr. Palaeoclim. Palaeoecology 246, p. 163-187.
(Throughout last glacial cycle, region between Australia and New Guinea (now Gulf of Carpentaria) oscillated from open shallow marine conditions to freshwater lake behind Arafura sill. Six ostracod biofacies in last 130 ka: (1) open shallow marine with bairdiids, pectocytherinids, cytherettids; (2) shallow marine dominated by Cytherella and Hemikrithe; (3) marginal marine with Xestoleberis and Praemunita; (4) tidal channel dominated by Loxoconcha; (5) estuarine with Venericythere and Leptocythere; (6) non-marine facies: brackish lagoon/lake dominated by Cyprideis and Leptocythere and freshwater with Ilyocypris, Cyprinotus and Cypretta. Also morphological variations within species tied to paleoenvironments)

Renault-Miskovsky, J. & A.M. Semah (1998)- Palynology of the Quaternary in temperate and tropical areas: chronostratigraphy, palaeoclimatology and vegetal environment of fossil man. In: N.M. Dutta et al. (eds.) Current concepts in pollen-spore and biopollution research (S. Chandra volume), Chapter 20, Research Periodicals and Book Publishing House, Houston, p. 297-317. *(online at: https://horizon.documentation.ird.fr/exl-doc/pleins_textes/pleins_textes_7/b_fdi_53-54/010021194.pdf)*
(General review of spores-pollen studies and applications in chronostratigraphy, paleoclimate and paleoenvironments. With examples from SE Asia, including work on Java Pleistocene hominid sites and Pleistocene climate changes on New Guinea, Sumatra, etc.)

Renema, W. (2003)- Larger foraminifera on reefs around Bali. Zoologische Verhandelingen, Leiden, 345, p. 337-366.
(online at: www.repository.naturalis.nl/document/46850)
(Recent larger foraminifera from Bali total 19 species. Species richness similar to SW Sulawesi and Cebu, but different composition. Schlumbergerella locally abundant and geographically restricted to Lesser Sunda Islands and Java. Very low abundance of imperforate species probably due to climatic or oceanographic parameters, most likely periodic upwelling, which causes seasonal seawater temperature drops)

Renema, W. (2005)- Depth estimation using diameter-thickness ratios in larger benthic foraminifera. Lethaia 38, p. 137-141.
(Diameter-thickness ratio (D/T) of Amphistegina and Operculina varies with depth. Increased turbulence thickens test, whilst decreased light intensity causes flatter tests)

Renema, W. (2006)- Large benthic foraminifera from the deep photic zone of a mixed siliciclastic-carbonate shelf off East Kalimantan, Indonesia. Marine Micropaleontology 58, p. 73-82.
(Modern large benthic forams on Berau shelf two-three depth-controlled assemblages (1) shallow (20-50m; dominated by Operculina ammonoides) and (2) deeper (50-85m; dominated by Operculina complanata and Planostegina operculinoides). Deepest living LBF at 115m. Cycloclypeus carpenteri between 55-95m)

Renema, W. (2006)- Habitat variables determining the occurrence of large benthic foraminifera in the Berau area (East Kalimantan, Indonesia). Coral Reefs 25, 3, p. 351-359.
(Composition of larger foram assemblages (35 species) on Berau carbonate shelf with barrier reef system and some reefs outside barrier. Four clusters corresponding to substrate type)

Renema, W. (2008)- Habitat selective factors influencing the distribution of larger benthic foraminiferal assemblages over the Kepulauan Seribu. Marine Micropaleontology 68, p. 286-298.

(On distribution of symbiont-bearing larger foraminifera on 'Thousand Islands' off Jakarta. Diversity and habitat fractionation increases as terrestrial and nutrient influence decline. Assemblages in nearshore reefs dominated by generalist species, while, additionally, more specialistic species occur at more offshore reefs)

Renema, W. (2010)- Is increased calcarinid (foraminifera) abundance indicating a larger role for macro-algae in Indonesian Plio-Pleistocene coral reefs? Coral Reefs 29, p. 165-173.
(Comparisons of large benthic foraminifera between areas with high (Kepulauan Seribu) and lower (Spermonde Archipelago) anthropogenic influence. Reefal habitats dominated by algae are inhabited by Calcarinidae larger foraminifera)

Renema, W. (2018)- Terrestrial influence as a key driver of spatial variability in large benthic foraminiferal assemblage composition in the Central Indo-Pacific. Earth-Science Reviews 177, p. 514-544.
(online at: https://www.sciencedirect.com/science/article/pii/S0012825217303410)
(Thorough review of Recent Indo-Pacific larger foraminifera and their distributions. Nutrient availability, hydrodynamic energy, light intensity, substrate type and temperature important environmental parameters controlling occurrence of larger foraminifera species. Terrestrial run-off also important environmental parameter. Calcarinids more abundant with increased algal cover)

Renema, W., R.J. Beaman & J.M. Webster (2013)- Mixing of relict and modern tests of larger benthic foraminifera on the Great Barrier Reef shelf margin. Marine Micropaleontology 101, p. 68-75.
(On distribution of live, well preserved, and relict larger foraminifera off shelf margin near Hydrographers Passage in Great Barrier Reef, Australia. Eight living species, mostly of families Amphisteginidae and Nummulitidae, separated into a shallow (platform) and deep (terrace) assemblages. Relict fauna more diverse, with taxa from much shallower settings (downslope transport from nearby Pleistocene coral reef structures))

Renema, W., D.R. Bellwood, J.C. Braga, K. Bromfield, R. Hall, K.G. Johnson, P. Lunt et al. (2008)- Hopping hotspots: global shifts in marine biodiversity. Science 321, p. 654-657. *(online at: www.researchgate.net/publication/23140202_Hopping_Hotspots_Global_Shifts_in_Marine_Biodiversity)*
(Fossil and molecular evidence reveals at least three hotspots of high marine biodiversity in past 50 million years. They moved across globe, with timing and locations coinciding with major tectonic events. Birth and death of successive hotspots highlights link between environmental change and biodiversity patterns. Antiquity of taxa in modern Indo-Australian Archipelago hotspot emphasizes role of pre-Pleistocene events)

Renema, W., B.W. Hoeksema & J.E. van Hinte (2001)- Larger benthic foraminifera and their distribution patterns on the Spermonde shelf, South Sulawesi. Zoologische Verhandelingen, Leiden, 334, p. 115-149.
(online at: www.repository.naturalis.nl/document/46294)
(Distribution patterns of 20 species of larger benthic foraminifera in Spermonde Archipelago, off SW Sulawesi. 13 transects sampled, down to 33m water depth. Substrate type, hydrodynamic energy, light intensity, nutrient availability and environmental stabiltity determine distribution)

Van de Paverd, P.J. & K.R. Bjorklund (1989)- Frequency distribution of polycystine radiolarians in surface sediments of the Banda Sea, Eastern Indonesia. In: J.E. van Hinte et al. (eds.) Proc. Snellius II Symposium, Jakarta 1987, Netherlands J. of Sea Research 24, 2, p. 511-521.
(Numbers of radiolarians in sea-floor sediments of Banda Sea vary widely: low from 0-950m, high between 950-4800m, and low again below 4800m water depth. Distribution reflect sediment influx and occurrence of highly productive areas in surface water)

Van de Paverd, P.J. & K.R. Bjorklund (1996)- Preservation and density of Late Quaternary radiolaria in piston cores from the Banda Sea, eastern Indonesia. Revista Espanola Micropaleontologia 28, 3, p. 139-152.

Van der Kaars, W.A. (1991)- Palynology of eastern Indonesian marine piston-cores: a Late Quaternary vegetational and climatic record for Australasia. Palaeogeogr. Palaeoclim. Palaeoecology 85, p. 239-302.
(Pollen analyses on Late Quaternary sediments from E Indonesia marine piston cores show vegetation and environmental record for E Indonesia and N Australia. On Halmahera and N Australia montane oak forest largely replaced tropical lowland vegetation during last glacial period, while climate was cooler and drier than today, with maximum grassland cover at ~18 ka. One piston-core (G6-4) extends to 300 ka. and also shows glacial periods characterised by expanding grassland vegetation (Graminae pollen peaks), and during interglacials increases in woodland and fern cover. Mangrove vegetation expansions suggest rises in sea-level at ~244, 220 and 130 ka)

Van der Kaars, S. (1998)- Marine and terrestrial pollen records of the last glacial cycle from the Indonesian region: Bandung Basin and Banda Sea. Palaeoclimates 3, p. 209-219.

Van der Kaars, S.F. Bassinot, P. de Deckker & F. Guichard (2010)- Changes in monsoon and ocean circulation and the vegetation cover of southwest Sumatra throughout the last 83,000 years: the record from marine core BAR94-42. Palaeogeogr. Palaeoclim. Palaeoecology 296, p. 52-78.
(Palynological record from deep-sea core off SW Sumatra used to reconstruct monsoon circulation and vegetation of SW Sumatra over the last 83 ky. During marine isotope stage (MIS) 5a, SW Sumatra was covered by rainforest. During MIS 4 conditions became drier, cooler and weaker monsoon. Vegetation most open during MIS 3, between ~52- 43 ky, driest of last glacial, also increase in montane pollen. After ~43 ky everwet climate gradually developed as monsoonal circulation intensified)

Van der Kaars, S. & R. Dam (1997)- Vegetation and climate change in West-Java, Indonesia during the last 135,000 years. Quaternary International 37, p. 67-71.
(Sediment cores from intramontane Bandung basin (W Java) provide paleoclimatic record for last 135,000 years. Anomalously dry conditions for penultimate glacial last glacial periods, very warm and humid conditions during last interglacial. For Last Glacial Maximum temperatures 4-7°C lower than present)

Van der Kaars, S., D. Penny, J. Tibby, J. Fluin, R.A.C. Dam & P. Suparan (2001)- Late Quaternary palaeoecology, palynology and palaeolimnology of a tropical lowland swamp: Rawa Danau, West-Java, Indonesia. Palaeogeogr. Palaeoclim. Palaeoecology 171, 3-4, p. 185-212.
(Open vegetation and drier climate suggested for Late Glacial time in Java, but no evidence for cooler conditions. Onset of Holocene coincides with change to more humid conditions. Changes in diatom composition reflect shallowing of lake)

Van der Kaars, S., X. Wang, A.P. Kershaw, F. Guichard & D.A. Setiabudi (2000)- A late Quaternary palaeoecological record from the Banda Sea, Indonesia; patterns of vegetation, climate and biomass burning in Indonesia and northern Australia. Palaeogeogr. Palaeoclim. Palaeoecology 155, p. 135-153. *(online at: https://www.academia.edu/17853126/A_Late_Quaternary_palaeoecological_record_from_the_Banda_Sea_Indonesia_patterns_of_vegetation_climate_and_biomass_burning_in_Indonesia_and_northern_Australia)*
(Banda Sea core SHI-9014 palynological and carbon isotope analyses provide a regional vegetation, fire and climate history for Banda Sea in last 180,000 years. During last two glacial periods drier climates in both E Indonesia and N Australia and lower montane forests expanded in E Indonesia indicating cooler climatic conditions. Before 37,000 yr BP. Dipterocarpaceae important part of lowland vegetation of E Indonesia. Subsequent demise likely related to increased human impact)

Van der Meer Mohr, J.C. (1927)- Note preliminaire sur la composition conchyliologique d'un amas prehistorique de coquilles pres de Medan (Sumatra). Miscellanea Zoologica Sumatrana, Medan, 18, p. 1-3.
('Preliminary note on shell composition of a prehistoric shell mound near Medan (Sumatra)'. Identifications of edible mollusc shells in 7m high and 50-60m long prehistoric shell midden/mound ('kjokkenmodding') in N Sumatra, at request of archeologist P.V. van Stein Callenfels. This mound is 'kitchen trash' from human settlements in coastal zone. Shells dominated by shallow marine-estuarine Meretrix meretrix (popularly known as 'Asiatic hard clam' from Venus group; 93%) and Ostrea (oyster; 6%), also some Arca and gastropods (NB: many original mounds destroyed by later mining activities for road cover and lime). Sumatra shell middens now 10-15 km inland from E coast of N Sumatra, in zone ~130 km long, and all located <5 m above sea level. Most recent estimate of age is ~6000 yr B.P., during mud-Holocene highstand. Similar shell mounds known from Malay Peninsula side of Malacca Straits) (Schurmann 1928, 1931, Van Heekeren 1972, Foo Shu Tien 2015))

Van Iperen, J.M., A.J van Bennekom & T.C.E. van Weering (1993)- Diatoms in surface sediments of the Indonesian Archipelago and their relation to hydrography. In: H. van Dam (ed.) Twelfth International Diatom Symposium, Renesse 1992, Hydrobiologia 269-270, 1, p. 113-128.
(Recent marine diatoms from 53 seafloor samples between 350-7200m water depth in Indonesian Archipelago, collected during Snellius II Expedition. Three assemblages, related to overlying water mass: (1) warm saline surface waters of Pacific and Indian Ocean origin (Thalassiosira oestrupii, Rhizosolenia bergonii); (2) low-salinity lobe in Makassar Strait ((Thalassionema frauenfeldii, Cyclotella striata); (3) seasonal upwelling areas in Arafura Sea and S of Java (Thalassionema nitzschioides, Chaetoceros resting spores). Also three groups of allochthonous species, indicators of productivity in littoral environment, bottom currents and river outflow)

Verheij, E. & P.L.A. Erftemeijer (1993)- Distribution of seagrasses and associated macroalgae in South Sulawesi, Indonesia. Blumea: Biodiversity, Evolution and Biogeography of Plants, 38, 1, p. 45-64.
(online at: https://repository.naturalis.nl/pub/524525/BLUM1993038001005.pdf)
(Eleven seagrass species found in Spermonde Archipelago, off South Sulawesi)

Victor, R. & C.H. Fernando (1979)- On some freshwater ostracod type specimens from Indonesia. Canadian Journal of Zoology 57, 1, p. 6-12.
(Re-description of some modern freshwater ostracod species from Sulawesi and Sumatra, originally described by Moniez (1892) (Strandesia, Hemicyprus, Cypretta))

Victor, R. & C.H. Fernando (1981)- Freshwater ostracods (Crustacea: Ostracoda) of the subfamily Cyprinotinae Bronstein, 1947 from Malaysia, Indonesia and the Philippines. Hydrobiologia 83, 1, p. 11-27.
(Recent Cyprinotus, Hemicypris and Heterocypris from ponds in W Indonesia, etc.)

Villain, J.M. (1995)- Modeles micropaleontologiques recents et stratigraphie sequentielle en Indonesie. In: M. Gayet et al. (eds.) First European Palaeontological Congress, Lyon 1993, Geobios, Memoire Special 18, p. 409-423.
('Recent micropaleontological models and sequence stratigraphy in Indonesia'. Foraminifera distribution on E Kalimantan shelf between Mahakam delta and Makassar Strait. Deltaic assemblages arranged according to salinity. Inner shelf with larger Rotaliidae towards euryhaline conditions. Operculina typical of shallow marine low-oxygen organic-rich clays; coarser seafloor rich in oxygen with Amphisteginids. Nodosariidae and planktonics bathymetric markers on slope. In bathyal areas mostly agglutinants. Model above valid only for highstand situations, comparable to present day. Sediments deposited during last lowstand period cored and correlated. Shelf microfaunas thin-walled, due to low oxygen and low carbonate concentrations; Rotaliidae indicate low salinities at shelf edge, where they coexist with Operculina and Amphistegina, close to deeper facies with planktonics, Buliminidae and Nodosariidae)

Von Martens, E. (1897)- Suss- und Brackwasser-Mollusken des Indischen Archipels. In: M. Weber (ed.), Zoologische Ergebnisse einer Reise in Niederlandisch Ost-Indien herausgegeben von Dr. Max Weber. Vierter Band, E.J. Brill, Leiden, p. 1-331.

('Scientific results of the voyage of Prince and Princess Leopold of Belgium to the East Indies, vol. 6, 1, Algae'. Rel. brief report on Recent calcareous algae from localities across Indonesia)

Weinmann, A.E., D. Rodder, S. Lotters & M.R. Langer (2013)- Heading for new shores: projecting marine distribution ranges of selected larger foraminifera. PLoS One 8, 4, e62182, p. 1-14.

(online at: https://journals.plos.org/plosone/article/file?id=10.1371/journal.pone.0062182&type=printable)
(Modern symbiont-bearing larger foraminifera confined to tropical and subtropical shallow marine habitats, mainly between 30°N and 30°S) and minimum T limits e governed by 14-20°C isotherms. During times of extensive global warming (Eocene, Miocene), larger foraminifera found as far N as 50°N and 47°S (New Zealand). Species distribution models for Archaias angulatus, Calcarina spp., and Amphistegina spp. Amphistegina spp. widest potential distribution (T tolerance). Calcarina most tolerant to high T)

Wells, P., G. Wells, J. Calli & A. Chivas (1994)- Response of deep sea benthonic foraminifera to Late Quaternary climate changes, SE Indian Ocean, offshore Western Australia. Marine Micropaleontology 23, p. 185-229.
(Late Quaternary benthic foraminifera of four ODP 122 deep-sea cores off W Australia with two main assemblages (1) dominated by Uvigerina peregrina, (2) dominated by U. proboscidea. Episodes of high influx of particulate organic matter during glacial episodes, tied to upwelling episodes and to unusually low sea-surface paleotemperature indicated by planktic foraminifera)

Whatley, R.C. & R. Titterton (1981)- Some new Recent podocopid Ostracoda from the Solomon Islands, South-West Pacific. Revista Espanola Micropaleontologia 13, p. 157-170.

Whatley, R.C. & K. Watson (1988)- A preliminary account of the distribution of ostracoda in Recent reef and reef associated environments in the Pulau Seribu or Thousand Island Group, Java Sea. In: T. Hanai et al. (eds.) Evolutionary biology of ostracoda: its fundamentals and applications, Proc. 9th Int. Symposium on Ostracoda, Shizuoka, Elsevier, Developments in Palaeontology and Stratigraphy 11, p. 399-411.
(Samples on and around reef complex of Pulau Pari, Pulau Seribu, Java Sea, yielded 141 species of podocopid and platycopid Ostra coda. Bairdiidae maximum diversity on reef, Renaudcypris and Hansacypris mainly in intertidal zone. Loxoconcha, Xestoleberis and Ornatoleberis wider environmental tolerance)

Whatley, R.C. & Q. Zhao (1987)- Recent ostracoda of Malacca Straits (Part I). Revista Espanola Micropaleontologia 19, 3, p. 327-366.
(18 bottom samples of modern sediments from Malacca Straits over depth range of 10-100m contain 129 species of ostracodes (22 new). Faunas close affinity to South China Sea and Indonesia)

Whatley, R.C. & Q. Zhao (1988)- Recent ostracoda of Malacca Straits (Part II). Revista Espanola Micropaleontologia 20, 1, p. 5-37.

Whittaker, J.E. & R.L. Hodgkinson (1995)- The foraminifera of the Pitcairn Islands. In: T.G. Benton & T. Spencer (eds.) Pitcairn Islands: biogeography, ecology and prehistory, Biol. J. Linnean Society 56, p. 365-371.
(Recent foraminifera from Pitcairn Islands, Pacific Ocean. Living forams almost exclusively from phytal (attached or clinging) habitats. Foraminifera in sediment samples mainly thanatocoenoses. Fauna all calcareous, low diversity, dominated by large soritids (Marginopora, Amphisorus, Sorites) and Amphistegina, with small miliolids and small attached genera (discorbids, etc.). Apparent absence of Calcarina, small rotaliids, elphidiids and agglutinating species, common in W Pacific islands)

Wicaksono, S.A., J.M. Russell & S. Bijaksana (2015)- Compound-specific carbon isotope records of vegetation and hydrologic change in central Sulawesi, Indonesia, since 53,000 yr BP. Palaeogeogr. Palaeoclim. Palaeoecology 430, p. 47-56.
(Carbon isotopic composition (δ13C) of terrestrial leaf waxes in sediment cores from Lake Matano spanning 53 kyr. During Marine Isotope Stages 1 and 3, more negative δ13Cwax values indicate closed-canopy rainforests dominated in Sulawesi, in wetter, less seasonal climate. More abundant open canopy vegetation and possible expansion of C4 grasses between 29-14 ka BP, indicating more arid climate in Marine Isotope Stage 2 (incl. Last Glacial Maximum). Higher elevations maintain rainforest refugia during regionally arid time intervals when C4 savannas and grasslands expanded at lower elevations)

Wijono, S. (1991)- Distribusi foraminifera bentonik di daerah peraian P. Papateo, Kepulauan Seribu, Laut Jawa. Media Teknik (UGM) 13, 2, p. 119-131.

'Distribution of benthic foraminifera off Papateo Island, Pulau Seribu, Java Sea'. Forams from 18 samples from 21-30m depth)

(2025)- The late Middle Pleistocene *Homo erectus* of the Madura Strait, first hominin fossils from submerged Sundaland. Quaternary Environments and Humans 3, 2, 100068, p. 1-11
(online at: https://www.sciencedirect.com/science/article/pii/S295023652500012X)
(Discovery of two hominin cranial fragments from submerged Sunda Shelf, retrieved during dredging work in Madura Strait, N of Surabaya, off NE Java coast. Specimens derive from sandy fill of late M Pleistocene paleovalley of Solo River and consist of two frontal and parietal fragments, resembling H. erectus crania from Sambungmacan. Madura Strait hominins probably part of MIS6 population that lived along Solo River, flowing E-eastward over exposed shelf area of Madura Strait, during rel. dry late M Pleistocene)

Berghuis, H.W.K., G. van den Bergh, T. van Kolfschoten, U.P. Wibowo,I. Kurniawan, S. Adhityatama, I. Sutisna et al. (2025)- First vertebrate faunal record from submerged Sundaland: the late Middle Pleistocene, hominin-bearing fauna of the Madura Strait. Quaternary Environments and Humans 3, 2, 100047, p. 1-48.
(online at: https://www.sciencedirect.com/science/article/pii/S2950236524000458)
(First vertebrate fossils from subsea Sundaland, from lowstand valley of Solo River in Madura Strait, N of Surabaya, OSL-dated to ~162 and ~ 119 ka (late M Pleistocene). At least 36 species: reptiles (turtles, crocodilians, varanids, pythons), sharks (incl. extinct Hemipristis serra) and stingrays. Lowland plains populated by herbivores (Hippopotamidae, Bovidae, Cervidae, Proboscidea (Stegodon, Elephas), suggesting grass-dominated environment similar to contemporaneous fossil assemblage of Ngandong (Java) (but with more estuarine species, fewer carnivores). Also rare Varanus komodoensis, Macaca sp. and Homo erectus)

Berghuis, H.W.K., T. van Kolfschoten, S. Adhityatama, S.R. Troelstra, S. Noerwidi, R.A.Suriyanto, U.P. Wibowo et al. (2022)- The eastern Kendeng Hills (Java, Indonesia) and the hominin-bearing beds of Mojokerto, a re-interpretation. Quaternary Science Reviews 295,107692, p. 1-25.
(online at: www.sciencedirect.com/science/article/pii/S0277379122003237)
(Re-interpretation of 1000m thick exposed marine-to-fluvial Late Pliocene-Pleistocene deposits in paleo-embayment in E Kendeng zone. Fluvial conglomerate with Mojokerto Homo erectus skullcap is tied to MIS14, with age of ~550ka (younger by 1 Myrs or more than previous age interpretations!). All earlier radiometric and paleomagnetic work discarded as wrong (this radical change in age is based mainly on sequence stratigraphic reasoning in a non-marine series, with no support from any new independent age data; JTvG)

Berghuis, H.W.K., T. van Kolfschoten, S. Adhityatama, S.R. Troelstra, S. Noerwidi, R.A.Suriyanto, U.P. Wibowo et al. (2023)- Response to the comment by Huffman and Zaim. Quaternary Science Reviews 307, 108059, p. 1-3.

('Hoabinhian' stone tools from Medan area, N Sumatra. Called 'sumatraliths', made of andesite. Named after E Holocene stone artifact assemblages from N Vietnam)

Brasseur, B. (2009)- Dynamique et histoire des depots du Pleistocene inferieur et moyen ancien du dome de Sangiran (Java central, Indonesie): caracterisation des surfaces d'occupation a *Homo erectus*. Ph.D. Thesis, Museum National Histoire Naturelle, Paris, p. 1-360. *(Unpublished)*
(online at: www.researchgate.net/publication/326655192_Dynamique_et_Histoire_des_depots_du_Plei Etc.)
('Dynamics and history of lower and early M Pleistocene deposits of Sangiran dome (central Java, Indonesia): characterization of Homo erectus occupation layers'. Thick Quaternary sediments of Sangiran dome with oldest human fossils dated to 1.5 Ma, but mainly in Bapang/Kabuh Fm fluvio-volcanic layers dated 1- 0.7 Ma (also with tektite horizon). Ngebung 2 hill with preserved human occupation surface dating to 0.8 Ma. Proposes reconstruction of rivers pathways and development at ~1.0 Ma of alluvial fan coming from N and linked to active tectonic phase. Frequent weathering and reworking of volcanic tuffaceous material may explain wide range of radiometric dates in hominid bearing series. Several mudflows rapidly covered Ngebung 2 H. erectus occupation surface)

Brasseur, B. (2020)- A younger “earliest human migration” to Southeast Asia. New dating suggests that hominids arrived at the Sangiran dome later than had been thought. Science 367, 6474, p. 147-148.
(Comment on Matsu’ura et al. (2020). For 25 years, two competing chronological frameworks for Sangiran sedimentary sequence: (1) “younger” chronology for hominid fossil layers (from 1.3- 1.1 Ma to 0.7- 0.6 Ma); and (2) “older” chronology (1.7- 1.6 Ma until 1 Ma). Matsu’ura et al. (2020) support “younger” model, with new dating of 3 tuffs: below hominid-bearing layers (1.34 Ma), Grenzbank (<0.97 Ma) and lowermost Bapang Fm (0.88 Ma). Also Perning hominin age rejuvenated to <1.49 Ma. “Younger” chronology for Sangiran hominids implies humans migrated from Asia to SE Asia ~300,000 years later than previous estimates)

Brasseur, B., M.A. Courty, B. Deniaux, N. Fedoroff, B. Poreda & F. Semah (2007)- The geodynamic context of the ca. 0.8 Ma layers in the Sangiran Dome (Central Java. Indonesia): traces of the fall-event linked to the Australasian tektites strewn field? In: N.R. (Normal and reversed magnetic polarities identified in Late Pliocene- Pleistocene in Sangiran Dome. Gauss-Matuyama boundary (2.48 Ma) just above Balanus Limestone of Puren Fm (U Kalibeng Fm). Normal polarity in Cemoro (Pucangan) Fm claystone probaly Olduvai event (~1.87-1.67 Ma). Base Jaramillo event (0.97 Ma) below 'Grenzbank' at base Bapang (Kabuh) Fm. Brunhes- Matuyama reverse to normal transition (0.73 Ma) between TB3 and TB4 tuff horizons in Bapang (Kabuh) Fm (see also Hyodo et al. 1988, 2011, Sunardi 2010))

Danisworo, C. (2001)- Stratigraphic position (in the Quaternary stratigraphy) and the age of *Pithecanthropus erectus* VIII discovered in the Sangiran area, Central Java. Proc. 30th Annual Conv. Indonesian Association Geologists (IAGI) and 10th Reg. GEOSEA Congress, Yogyakarta, Majalah Geologi Indonesia (IAGI) 16, Special Edition, p. 131-139.
(Pithecanthropus erectus VIII skull considered to be from within Jagan Tuff Member, lower Bapang Fm., between 0.97- 0.90 Ma old, or in Pleistocene Jaramillo magnetic event)

Das, I. (1997)- A reassessment of *Hardella isoclina* Dubois, 1908 (Testudines: Bataguridae) from the Trinil beds of the Javan Pleistocene. Herpetological Journal 7, 2, p. 71-73.
(online at: https://www.thebhs.org/publications/the-herpetological-journal/volume-7-number-2-april- Etc.)
(Fossil turtle excavated from Trinil, C Java, and described by E. Dubois in 1908; holotype and sole example of this fossil turtle is at the Leiden Nationaal Natuurhistorisch Museum (NNM; now Naturalis). Here attibuted to genus Mauremys (called Duboisemys isoclina (Dubois, 1908) by Karl et al., (2019) and viewed as aquatic river turtle)

Dawson, M.R. (1971)- Fossil mammals of Java I. Notes on Quaternary Leporidae (Mammalia, Lagomorpha) from Central Java. Proc. Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam, B74, p. 27-32.
(On fossil rabbits/ hares from Pleistocene of Sangiran, C. Java)

D'Cunha, M.G.T., A. Montenegro & J.S. Field (2021)- Modeling water crossings leading to the arrival of early Homo in Sulawesi, Indonesia, via paleoclimate drift experiments. J. Archaeological Science: Reports 40, A, 103194, p. 1-12.
(Lithic tools found at Talepu, Sulawesi, in Wallacea suggest that unidenfied hominins (but predating Homo sapiens; Denisovans?) occupied Sulawesi between ~ 118-194 ka. Borneo most likely departure point. Mindanao departures more likely to arrive in Sulawesi than those from Banda Arc)

De Almeida, A. & G. Zbyszewski (1967)- A contribution to the study of the prehistory of Portuguese Timor lithic industries. In: W. G. Solheim (ed.) Archaeology at the Eleventh Pacific Science Congress. (Asian and Pacific Archaeology, Series 1, Honolulu), p. 55-67).
(One of first records of human stone artifacts from E Timor, from Lene Hara cave. Made from jasper and chert (later more systematic excavations at this locality reported by O'Connor et al. 2002))

De Bruyn, M., B. Stelbrink, R.J. Morley, R. Hall, G.R. Carvalho, C.H. Cannon, G. van den Bergh, E. Meijaard, I. Metcalfe, L. Boitani, L. Maiorano, R. Shoup & T. von Rintelen (2014)- Borneo and Indochina are major evolutionary hotspots for Southeast Asian biodiversity. Systematic Biology 63, 6, p. 879-901
(manuscript online at: https://ro.uow.edu.au/articles/journal_contribution/Borneo_and_Indochina_are_major_evolutionary_hotspots_for_Southeast_Asian_biodiversity/27787422?file=50557956)
(SE Asia (in particular Borneo and Indochina) major 'evolutionary hotspots' for diverse range of fauna- flora. Most of SE Asia's biodiversity result of accumulation of immigrants and in situ diversification. Colonization events comparatively rare from younger emergent islands like Java, which show increased immigration events)

Delfino, M. & J. De Vos (2010)- A revision of the Dubois crocodylians, *Gavialis bengawanicus* and *Crocodylus ossifragus*, from the Pleistocene *Homo erectus* beds of Java. J. Vertebrate Paleontology 30, p. 427-441.
(online at: https://www.researchgate.net/publication/232667880_A_Revision_of_the_Dubois_Crocodylians_Gavialis_Bengawanicus_and_Crocodylus_Ossifragus_from_the_Pleistocene_Homo_Erectus_Beds_of_Java)
(Revision of two extinct Javanese crocodylian species Gavialis bengawanicus Dubois 1908 and Crocodylus ossifragus Dubois 1908 (= C. siamensis Schneider 1801). Both found in Trinil, with Stegodon- Homo erectus fauna, which is considered to be result of E Pleistocene dispersal from Siwaliks Hills via Siva-Malayan route)

Delfino, M. & J. De Vos (2014)- A giant crocodile in the Dubois Collection from the Pleistocene of Kali Gedeh (Java). Integrative Zoology 9, 2, p. 141-147.
(Unpublished crocodylian specimen collected by Dubois in latest E Pleistocene of Kali Gedeh tentatively referred to genus Crocodylus. ~1m long lower jaw indicate total length of ~6-7m)

Delson, E., K. Harvati, D. Reddy, L.F. Marcus, K. Mowbray, G.J. Sawyer, T. Jacob & S. Marquez (2001)- The Sambungmacan 3 *Homo erectus* calvaria: a comparative morphometric and morphological analysis. Anatomical Record 262, 4, p. 380-397.
(online at: https://onlinelibrary.wiley.com/doi/10.1002/ar.1048)
(Sambungmacan (Sm) 3 calvaria, discovered on Java in 1977, presumably dredged from bank of Solo River near Sambungmacan. It was illegally removed from Indonesia in 1998 and appeared in New York City natural history shop in early 1999, now at Gadjah Mada University. Age unknown, but Sm 3 skull features intermediate between classic Homo erectus and more modern humans, with greatest similarity to specimens from Ngandong)

De Vos, J., A. Bouteaux & A. Bautista (2007)- The mammalian faunas chronology in island Southeast Asia. In: A.M. Semah & K. Setiagama (eds.) First Islanders; human origins patrimony in Southeast Asia, p. 81-84.
(online at: http://hopsea.mnhn.fr/pc/brochures/2007HOPseaFI.pdf)
(Brief review of Pleistocene mammal fauna evolution of SE Asia. Parts of Java first emerged above sea level at ~1.8 Ma. First mammals to reach Java unbalanced island fauna (Satir Fauna of Bumiayu and Sangiran, with hippos (Hexaptotodon), cervids and mastodon (Sinomastodon bumiajuensis)). At 1.2 Ma better connection with Java, with arrival of more balanced Ci Saat fauna, including tigers, and more diverse Trinil Fauna with Homo erectus no later than 1.0 Ma. Around 0.8 Ma new migration to Java (Kedung Brubus Fauna, with first Elephas). Next fauna is Ngandong Fauna that includes Solo Man, a Homo erectus with larger brain size than older forms, that lived until ~0.2 Ma. Final faunas Punung Fauna (~120ka) and Wajak Fauna, both tropical rainforest assemblages, with Homo sapiens)

De Vos, J., S. Sartono, S. Hardja-Sasmita & P.Y. Sondaar (1982)- The fauna from Trinil, type locality of *Homo erectus*: a reinterpretation. Geologie en Mijnbouw 61, 2, p. 207-211.

(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0ZlN5anhJdHF5YWs/view)
(Revision of Von Koenigswald's mammal stratigraphy. Fauna at Trinil type locality rel. low in species and is older than 'Jetis-fauna' of Von Koenigswald 1934 (= Kedung Brubus fauna). Many endemic species, suggesting island setting (see also comments of Bartstra (1983) defending Von Koenigswald's work, and discussion of Hooijer and Kurten (1984))

De Vos, J. & P.Y. Sondaar (1982)- The importance of the 'Dubois collection' reconsidered. Modern Quaternary Research in Southeast Asia 7, Balkema, Rotterdam, p. 35-63.
(Review of Dubois collection of Pleistocene mammals from C Java, mainly from excavations at Trinil along Solo River and Kedung Brubus near Madiun in 1890's. Material in Naturalis Museum, Leiden, since. Much of material not collected in stratigraphic context. With locality maps and listings of species)

De Vos, J. & P.Y. Sondaar (1994)- Dating hominid sites in Indonesia. Science 266, p. 1726-1727.
(Question correctness of Swisher et al. (1994) older-than-generally-accepted new radiometric ages of pumice associated with Java hominids at Mojokerto and Sangiran sites of C Java (1.8-1.66 Ma instead of 'conventional' 0.97-0.73 Ma))

De Vos, J., P.Y. Sondaar, G.D. van den Bergh & F. Aziz (1994)- The *Homo* bearing deposits of Java and its ecological context. In: J.L. Franzen (ed.) 4th International Conference 100 years of *Pithecanthropus*. The *Homo erectus* problem, Frankfurt 1991, Courier Forschungsinstitut Senckenberg 171, p. 129-140.
(online at: www.researchgate.net/publication/281085976_The_Homo_bearing_deposits_of_Java_and_i Etc.)
(Discussion of Quaternary faunal succession of Java: (1) Satir (lower Kali Klagah series in Bumiayu; island fauna), (2) Ci Saat (upper Kali Glagah, Sangiran upper Black Clay; 1.2 Ma), (3) Trinil H.K. (1 Ma; with first Homo erectus; large amounts of bovids suggest rel. dry, glacial period), (4) Kedung Brubus Fauna (= upper Bapang Fm at Sangiran, ~0.8 Ma; also rel. dry climate), (5)Ngandong (with Homo erectus soloensis), (6) Punung (Late Pleistocene; common primates indicates humid tropical forest environment; last interglacial?), (7) Wajak (Wajak cave; Holocene with Homo sapiens). All Pleistocene Java hominids are Homo erectus, but with several subspecies)

(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/304)
(2009 discovery of nearly complete skeleton of Pleistocene elephant Elephas hysudrindicus in Solo River terrace in Sunggun area near Medalem Village (not clear from what part of Pleistocene/ terrace level?; JTvG). Some precipitation of calcite and other authigenic minerals)

Herrera, R.J. & R.G.-Bertrand (2022)- Interwoven evolution of *Homo erectus, Homo floresiensis*, and *Homo sapiens*. In: Sex and cohabitation among early humans, Elsevier, Chapter 16, p, 551-573.
(General review. Homo erectus was first of hominin ancestors to have sapiens-like body proportions (shorter arms and longer legs relative to its torso). H. erectus was also first hominin to migrate out of Africa and survived for more than 1.5 Myrs. Etc.)

Hertler, C., A. Bruch & M. Marker (2013)- The earliest stages of hominin dispersal in Africa and Eurasia. In: I. Ness (ed.) The Encyclopedia of Global Human Migration, Blackwell Publishing, Chapter 2, p. 1-9.
(online at: www.academia.edu/5016352/The_earliest_stages_of_hominin_dispersal_in_Africa_and_Eurasia)
(Brief review of earliest movements of hominins (proto-humans) in Africa, starting from ~7 Ma, and focusing on genesis of Australopithecus and Homo and dispersal into Eurasia soon after 2 Ma. Earliest evidence for hominins in E Asia is from C Java (Lower Pleistocene Homo erectus from Sangiran, with age of >1.5 Ma)

Hertler, C. & Y. Rizal (2005)- Excursion guide to the Pleistocene hominid sites in Central and East Java. JW Goethe University, Frankfurt, and ITB Bandung, p. 1-35.
(at www.palaeo.net/biologie/material/Excursion%20guide.pdf)
(Overview of Pleistocene mammal fauna biostratigraphy, paleoanthropology and fossil hominid sites)

Hertler, C., Y. Rizal & Y. Zaim (2007)- Habitat differentiation in the Pleistocene of Jawa- Introduction of the new Pleistocene fossil locality Majalengka. Courier Forschungsinstitut Senckenberg 259, p. 165-175.
(Pleistocene mammal faunas from Java three successive faunas based proboscidean genera: (1) E Pleistocene Mastodon-Geochelone fauna, (2) early M Pleistocene Stegodon- Homo erectus fauna and (3) late M Pleistocene Elephas- Homo sapiens fauna. Stegodon- Homo erectus fauna contains elements from successive migration waves and different ecological settings. Introduce model for endemic evolution in Java and newly discovered Pleistocene mammal locality in W Java)

Hertler, C., A.A.E. van der Geer, M.R. Puspaningrum, J.O Reschke, I.P. Anwar & E. Holzchen (2025)- *Stegodon* SEA-crossing: Swim, shrink, and disperse. Earth History and Biodiversity 4, 100026, p. 1-15.
(online at: https://www.sciencedirect.com/journal/earth-history-and-biodiversity/vol/4/suppl/C)
(Stegodons, an extinct family of proboscideans, managed to settle on roughly a dozen Wallacean (E Indonesia) islands during Pleistocene (Java, Flores, Sangihe, Sumba, Timor, Sulawesi, Luzon, Mindanao, Japan). Distribution interaction of (1) swimming performances and (2) island dwarfing. Reduction of body mass likely negatively affected swimming performance. No fossil record for Stegodon Maluku islands or in New Guinea/ NW Australia. With dispersal routes scenarios across Sundaland- Wallacea)

Hertler, C. & R. Volmer (2005)- Assessing prey competition in fossil carnivore communities- a scenario for prey competition and its evolutionary consequences for tigers in Pleistocene Java. Palaeogeogr. Palaeoclim. Palaeoecology 257, p. 67-80.
(online at: http://www.roceeh.net/fileadmin/download/Publications/Hertler-volmer-2008.pdf)
(Five carnivore species overlapped in time in Java Pleistocene: two pantherines, a hyaenid and two canid species, each in one or more faunal levels. Significant increase in body mass of tigers in Ngandong faunal level reflects intense competition among carnivores in preceding Kedung Brubus level)

Hidayah, A.R., U.P. Wibowo, A. Purwoarminta, G.J. Price & S. Noerwidi (2021)- Palaeoenvironments and palaeontology of the Atambua Basin, West Timor, Indonesia. Proc. 1st Asia-Pacific Conference on Human Evolution, Quaternary International 603, p. 82-89.
(M Pleistocene or earlier vertebrate faunas long known from Timor, but rarely studied. Dwarf proboscideans such as Stegodon once widespread across Timor, including Atambua Basin, but cause of extinction unknown. No example yet of direct association of lithic artefacts with extinct Pleistocene faunas: vertebrate fossils from M Pleistocene or earlier, predating oldest records of modern humans on Timor since~45,000 years ago)

Hilgen, S.L., F.J. Hilgen, S. Adhityatama, K.F. Kuiper & J.C.A. Joordens (2022)- Towards an astronomical age model for the Lower to Middle Pleistocene hominin-bearing succession of the Sangiran Dome area on Java, Indonesia. Quaternary Science Reviews 297, 7, 107788, p. 1-19.
(online at: https://www.sciencedirect.com/science/article/pii/S027737912200419X?via%3Dihub)
(Milankovitch cycle control applied to grain size cyclicity observed in Pleistocene of Sangiran and Bapang Fms. Onset of Mid-Pleistocene Transition with age of ~1.2 Ma in Upper Sangiran Fm ('even though multiple tuning options are still possible'. Tuned ages mostly consistent with 'short' paleoanthropological chronology, i.e. ~1.2 or 1.27 Ma for first arrival of Homo erectus)

Hilgen, S.L., E. Pop, S. Adhityatama, T.A. Veldkamp, H.W.K. Berghuis, I. Sutisna, D. Yurnaldi, G. Dupont-Nivet et al. (2023)- Revised age and stratigraphy of the classic *Homo erectus*-bearing succession at Trinil (Java, Indonesia). Quaternary Science Reviews 301, 107098, p. 1-18.
(online at: https://www.sciencedirect.com/science/article/pii/S027737912200539X)
(New chronostratigraphic framework for Trinil site from 40Ar/39Ar, paleomagnetic and luminescence (pIRIR290) dating methods. Two distinct Pleistocene fossiliferous channel fills (1) lower Bone-bearing channel 1 dates to 830-773 ka, (2) Bone-Bearing Channel 2 ~430-450 ka. Also significantly younger T2 terrace deposits. Dubois may have excavated fossils from three fossiliferous units with different ages)

(online at: www.repository.naturalis.nl/document/150627)
(Descriptions of new mammal material collected by 1970 Dutch-Indonesian expedition to Beru area, Sulawesi. Additional material of Archidiskodon celebensis, Stegodon sompoensis, S. cf. trigonocephalus, Celebochoerus heekerei and Anoa depressicorni)

Hooijer, D.A. (1974)- *Elephas celebensis* (Hooijer) from the Pleistocene of Java. Zoologische Mededelingen 48, 11, p. 85-93.
(online at: www.repository.naturalis.nl/document/150495)

Hooijer, D.A. (1975)- Quaternary mammals west and east of Wallace's line. In: G.J. Bartstra & W.A. Casparie (eds.) Modern Quaternary Research in Southeast Asia, A.A. Balkema, Rotterdam, 1, p. 37-51.
(Introduces concept of hypothetical M Pleistocene 'Stegoland' landmass, comprising Flores, Timor and Sulawesi, characterized by pygmy stegodonts S. sompoensis (based on erroneous assumption that elephants are not good swimmers and therefore unlikely to migrate between islands; JTvG))

Hooijer, D.A. (1975)- Quaternary mammals west and east of Wallace's line. Netherlands J. Zoology. 25, p. 46-56.
(Same paper as above)

Hooijer, D.A. (1981)- What, if anything new, is *Stegodon sumbaensis* Sartono? Modern Quaternary Research in Southeast Asia 6, Balkema, Rotterdam, p. 89-90.
(Nature of Sumba Stegodon described by Sartono (1979) still uncertain. Not necessarily pygmy Stegodon)

Hooijer, D.A. (1982)- The extinct giant land tortoise and the pygmy stegodont of Indonesia. Modern Quaternary Research in Southeast Asia 7, Balkema, Rotterdam, p. 171-176.
(Mainly critical discussion of Sondaar (1981) paper on Geochelone faunas. All known Geochelone tortoises in Indonesia can be grouped in G. atlas and made their way to Indonesian islands by overseas dispersal (not land bridges). All pygmy stegodonts are conspecific, Stegodon sompoensis)

Hooijer, D.A. (1982)- Premolars of *Elephas planifrons* Falconer & Cautley from the Pleistocene of Java. Proc. Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam, B85, 3, p. 265-272.

Hooijer, D.A. (1983)- Comment II: Remarks upon the Dubois collection of fossil mammals from Trinil and Kedungbrubus in Java. Geologie en Mijnbouw 62, p. 337-338.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0TXdLZ3dtNVloTHc/view)

(Comments on De Vos and Sondaar (1982) and De Vos et al. (1982) papers on Dubois collection. Part of problem is that the Dubois collections from Trinil may come from two different deposits: M Pleistocene Kabuh Fm and Late Pleistocene terrace sediments. Also Dubois collection from Kedungbrubus- Gunung Butak is mixture of Late Pliocene- E Pleistocene Jetis and M Pleistocene Trinil fauna)

Hooijer, D.A. (1984)- The mammalian faunas of Trinil and Kedungbrubus in Java once more. Modern Quaternary Research in Southeast Asia 8, Balkema, Rotterdam, p. 95-102.
(Comments on De Vos et al. (1982) and Sondaar et al. (1983) papers. Hooijer does not accept that the more diverse Kedungbrubus fauna is younger than Trinil fauna, but are roughly equivalent)

Hooijer, D.A. & B. Kurten (1984)- Trinil and Kedungbrubus: the *Pithecanthropus*-bearing fossil faunas of Java and their relative age. Annales Zoologici Fennici 21, p. 135-141.
(online at: http://www.sekj.org/PDF/anzf21/anzf21-135-141.pdf
(Authors dispute De Vos (1982) interpretation of Trinil mammal fauna as older than Kedungbrubus fauna)

Hope, G.S. & S.G.Haberle (2005)- The history of the human landscapes of New Guinea. In: A. Pawley et al. (eds.) Papuan pasts: cultural, linguistic and biological histories of Papuan-speaking peoples, Australian National University, Canberra, p. 541-554.
(online at: http://palaeoworks.anu.edu.au/pubs/Hope&Haberle05.pdf)
(Humans have been in highland valleys of New Guinea for at least 30,000 years and presumably occupied savannah plains that then connected New Guinea to Australia for 50,000 years or more)

Houbolt, J.H. (1940)- Bijdrage tot de kennis van der verspreiding van Palaeolithische artefacten in Nederlandsch-Indië. Tijdschrift Indische Taal Land en Volkenkunde 80, p. 614-617.
('Contribution to the knowledge of the distribution of Paleolithic artefacts in the Netherlands Indies')

Hrdlicka, A. (1930)- The skeletal remains of early Man. Smithsonian Miscellaneous Collections 83, p. 1-379.
(online at: https://repository.si.edu/handle/10088/24010)
(Review of fossils of early Man worldwide. Book contains a section on Pithecanthropus fossils of Dubois (which H. was allowed by Dubois to inspect at the Teylers Museum in Haarlem in 1923) and Hrdlicka's visit to the Trinil Site in May 1924. Also describes the 'discovery' of second Pithecanthropus skull cap at Trinil by a Dr. C.E.J. Heberlein from Surabaya in August 1926, which turned out to be a kneecap of a Stegodon elephant)

Huffman, O.F. (1998)- An Early Pleistocene way of life- *Homo erectus* of Sangiran Dome, Central Java. In: P. Lunt, R. Netherwood & O F. Huffman (eds.) Guidebook for field trip to Central Java, Oct 1998, Indonesian Petroleum Association (IPA), Jakarta, p. 1-15.

Huffman, O.F. (1999)- Pleistocene environmental variety in eastern Java and early *Homo erectus* paleoecology- a geological perspective. Buletin Geologi (ITB) 31, 2, p. 93-107
(Late Pliocene-Pleistocene paleogeography of E Java. Homo erectus homeland was volcanic archipelago)

Huffman, O.F. (2001)- Plio-Pleistocene environmental variety in eastern Java and early *Homo erectus* paleoecology- a geological perspective. In: T. Simanjuntak et al. (eds.) Sangiran: man, culture, and environment in Pleistocene times, Proc. International Colloquium on Sangiran, Solo- Indonesia, Solo 1998, National Research Centre of Archaeology, Yayasan Obor Indonesia, Jakarta, p. 231-256.
(online at: www.utexas.edu/cola/depts/anthropology/projects/huffman/6-SoloProc2001.pdf)
(Same paper as above. Homo erectus' homeland was volcanic archipelago with variety of paleoenvironments like Java today. With Late Pliocene-Pleistocene paleogeography; similar to Huffman (1999))

Huffman, O.F. (2001)- Geologic context and age of the Perning/Mojokerto *Homo erectus*, East Java. J. Human Evolution 40, 4, p. 353-362.
(Perning/Mojokerto Homo erectus from Upper Pucangan Fm in E Kendeng hills of E Java likely to be of latest Pliocene age (1.81 Ma radiometric age of hornblende in associated tuff; Swisher et al.) and reflect early H.

erectus occupation of Java (but relation of tuff and Mojokerto skull debated in later literature, e.g. Huffman et al. 2006; JTvG)

Huffman, O.F., A.W.J. Berkhout, P.C.H. Albers, J. de Vos & F. Aziz (2022)- Geology and discovery record of the Trinil *Pithecanthropus erectus* site, Java. PaleoAnthropology 2022, 2, p. 266-326.
(online at: https://paleoanthropology.org/ojs/index.php/paleo/article/view/83/773)
(Extensive documentation of Trinil type locality of Homo erectus and excavations by the Dubois team in 1891-1893, the Selenka Expedition 1907-1908, etc. Associated Pleistocene mammal fossils of extinct 'Trinil Fauna' in Pithecanthropus erectus discovery bonebed ('Hauptknochenschicht') include Axis lydekkeri, Duboisia santeng and Stegodon trigonocephalus. Terrestrial-vertebrate elements overwhelmingly disarticulated and frequently broken, with little indication of fluvial abrasion. No indication of hominin or carnivore involvement in deaths reported, suggesting catastrophic mortality along floodplain of a paleo-river, followed by lahar-flood deposition of gravel-size lithic and biotic materials)

Huffman, O.F., J. de Vos, A.W. Berkhout & F. Aziz (2010)- Provenience reassessment of the 1931-1933 Ngandong *Homo erectus* (Java), confirmation of the Bone-bed origin reported by the discoverers. PaleoAnthropology 2010, p. 1-60.
(online at: www.paleoanthro.org/journal/content/PA20100001.pdf)
(Geologists of Geological Survey of Netherlands Indies unearthed 14 Homo erectus fossils in 1931-1933 from Excavation site I Ngandong. Hominin discoveries and other vertebrate remains from thin, gravelly volcaniclastic stratum near base of fluvial terrace remnant ~20m above Solo River)

Huffman, O.F., P. Shipman, C. Hertler, J. de Vos & F. Aziz (2005)- Historical evidence of the 1936 Mojokerto skull discovery, East Java. J. Human Evolution 48, p. 321-363.
(Extensive review of history of discovery of Mojokerto child skull (Perning 1) in E Java in 1936, from hill-slope outcrop of folded conglomeratic sandstone in Duyfjes' Pucangan Fm on Kedungwaru anticline. Now accepted as Homo erectus (long believed one of oldest hominids from Java. Radiometric age of 1.81 ± 0.04 Ma from pumice near discovery section by Swisher et al., 1994, but may be from deeper beds; Huffman et al. 2006)

Huffman, O.F. & Y. Zaim (2003)- Mojokerto Delta, East Jawa: paleoenvironment of *Homo modjokertensis*- first results. J. Teknologi Mineral (ITB), 10, 2, p.
(manuscript online at: www.utexas.edu/cola/files/793055)
(Homo modjokertensis remains found in 1936 found in situ in Plio-Pleistocene bedrock at Perning site, SW of Surabaya. With Plio-Pleistocene paleogeographic map. Discovery site formed as fluvial channel on delta plain of ancient Mojokerto Delta)

Huffman, O.F. & Y. Zaim (2003)- Geological age estimate for the Mojokerto child's skull Homo erectus. Comment on Berghuis et al. "The eastern Kendeng Hills (Java, Indonesia) and the hominin-bearing beds of Mojokerto, a re-interpretation" [Quat. Sci. Rev. 295 (2022) 107692]). Quaternary Science Reviews 307, 108058, p. 1-4.
(Disagree with Berghuis et al. (2022) analysis of stratigraphic context of Mojokerto child's skull, unearthed near Perning in 1936)

Huffman, O.F., Y. Zaim, J. Kappelman, D.R. Ruez, J. de Vos, Y. Rizal, F. Aziz & C. Hertler (2006)- Relocation of the 1936 Mojokerto skull discovery site near Perning, East Java. J. Human Evolution 50, p. 431-451.
(Mojokerto skull discovery site was probably in beds 20m higher than ash layer dated as 1.81 Ma by Swisher et al. 1994, 2000)

Husain, M., S. Eko, H.A. Mahfi, W. Sunata & P. Sanyoto (1997)- Magnetostratigrafi daerah Patiayam, Kudus, Jawa Tengah. Proc. 22nd Annual Conv. Indonesian Association Geophysicists (HAGI), Bandung, p.
('Magnetostratigraphy of the Patiayam area, Kudus, C Java'. Hominid fossils in Patiayam area near Top Brunhes normal polarity subchron)

Husson, L., T. Salles, A.E. Lebatard, S. Zerathe, R. Braucher, S. Noerwidi, S. Aribowo et al. (2022)- Javanese *Homo erectus* on the move in SE Asia circa 1.8 Ma. Nature Scientific Reports 12, 19012, p. 1-12.
(online at: https://www.nature.com/articles/s41598-022-23206-9)
(Reappraisals of age dates (including new cosmic nucleids technology; TCN), suggest H. erectus reached Java and dwelled at Sangiran, Java at ~1.8 Ma. Hospitable terrestrial conditions of Sundaland facilitated prior dispersal of hominins to edge of Java, where they waited until Java archipelago emerged from sea and connected to Sundaland. Dispersal of H. erectus across Sundaland occurred over 10s to 100s kyr (N.B: TCN age of Grenzbank here suggested to be 1.78 +/- 0.35 Ma; i.e. much older than the widely accepted age of ~1Ma; JTvG)

Hutterer, K.L. (1983)- Absolute dates for the hominid-bearing deposits in Java: an overview. Asian Perspectives 25, 2, p. 53-65.
(online at: https://scholarspace.manoa.hawaii.edu/bitstream/10125/19247/1/AP-v25n2-53-65.pdf)
(Literature review of published radiometric dates of Upper Pucangan Beds (~0.85-1.2 Ma; with 'Djetis Fauna near top at ~0.8 Ma) and Lower Kabuh Beds (~0.5-0.7 Ma; with Trinil Fauna, ~0.5 Ma) and Notopuro Beds (<0.1 Ma; with Ngandong Fauna). Tektite from Sangiran 730,000 ± 50,000 yrs)

Hyodo, M. (2001)- The Sangiran geomagnetic excursion and its chronological contribution to the Quaternary geology of Java. In: T. Simanjuntak et al. (eds.) Sangiran: man, culture, and environment in Pleistocene times, Proc. International Colloquium on Sangiran, Solo- Indonesia 1998, National Research Centre of Archaeology, Yayasan Obor, Jakarta, p. 320-335.
(Sangiran geomagnetic excursion, characterized by westerly declinations, ranges from below T1 Tuff up to just above diatomite layer in Pucangan Fm. Age estimated 1.56-1.48 Ma. Good time marker for tectonic event in M Matuyama chron in C and E Java)

Hyodo, M., S. Matsu'ura, Y. Kamishima, M. Kondo, Y. Takeshita, I. Kitaba, T. Danhara, F. Aziz, I. Kurniawan & H. Kumai (2011)- High-resolution record of the Matuyama-Brunhes transition constrains the age of Javanese *Homo erectus* in the Sangiran dome, Indonesia. Proc. National Academy of Sciences USA (PNAS) 108, 49, p. 19563-19568.
(online at: https://www.pnas.org/doi/pdf/10.1073/pnas.1113106108)
(Paleomagnetic study in Sangiran area. A reverse-to-normal polarity transition in 7m thick section across Upper Tuff in Bapang (= Kabuh) Fm, showing 3 short reversal episodes overlain by thick normal polarity magnetozone, a pattern that closely resembles Matuyama-Brunhes transition (~0.78 Ma). Hominid last occurrence and tektite level in Sangiran nearly coincident, just below Upper Middle Tuff, which underlies MB transition. Meteorite impact preceded M-B reversal by ~12 ka)

Hyodo, M., H. Nakaya, A. Urabe, H. Saegusa, S. Xue, J. Yin & X. Ji (2002)- Paleomagnetic dates of hominid remains from Yuanmou, China, and other Asian sites. J. Human Evolution 43, 1, p. 27-41.
(Geomagnetic data suggest Homo erectus-affinity Yuanmou, SW China, hominid remains from early Brunhes chron ~0·7 Ma). Hominid fossils from Sangiran and Mojokerto, Java, do not exceed 1·1 Ma in age)

Hyodo, M., W. Sunata & E.E. Susanto (1990)- A long-term geomagnetic excursion from Plio-Pleistocene sediments in Java. In: M. Kono (ed.) Rock magnetism and paleogeophysics 17, Tokyo, p. 31-37. *(online at: http://peach.center.ous.ac.jp/rprep/Rock%20Magnetism%20and%20Paleogeophysics%20vol17%201990.pdf)*
(Similar to Hyodo, Sunata & Susanto et al., 1992))

Hyodo, M., W. Sunata & E.E. Susanto (1992)- A long-term geomagnetic excursion from Plio-Pleistocene sediments in Java. J. of Geophysical Research 97, B6, p. 9323-9335.
(Paleomagnetic records from Sangiran and Mojokerto suggest large-scale declination swing between Olduvai and Jamarillo events, lasting ~130,000 years)

Hyodo, M., W. Sunata, E.E. Susanto & H. Wahyono (1988)- Paleomagnetism of Plio-Pleistocene sediments in Sangiran, Central Java. In: M. Kono (ed.) Rock magnetism and paleogeophysics 15, DELP Publ. 23, Tokyo, p. 31-34. *(online at: http://peach.center.ous.ac.jp/rprep/Rock%20magnetism%20and%20Paleogeophysics%20vol15%201988.pdf)*

Nine polarity boundaries were located in outcrops of Sangiran area. The stratigraphic levels with Pithecantropus fossils (uppermost Pucangan- Kabuh Fms) range from lower boundary of Jaramillo event at 0.97 Ma to Brunhes-Matuyama boundary at 0.73 Ma)

Hyodo, M., N. Watanabe, W. Sunata & E.E. Susanto (1993)- Magnetostratigraphy of hominid fossil bearing formations in Sangiran and Mojokerto, Java. Anthropological Science 101, 2, p. 157-186.
(online at: https://www.jstage.jst.go.jp/article/ase1993/101/2/101_2_157/_pdf)
(Also in Rock magnetism and paleogeophysics 19 (1992). Paleomagnetic study of Plio-Pleistocene formation at Sangiran and Mojokerto. Levels of hominid fossils in Sangiran range from lower Jamarilo event at 0.97 Ma to Brunhes-Matayama boundary at 0.73 Ma. Homo modjokertensis in Mojokerto lies at lower border of Jamarillo event at 0.97 Ma)

Indonesia-Japan Research Cooperation Programme (CTA-41) (1979)- Progress report of the Indonesia-Japan joint research project on geology of human fossil bearing formations in Java. Bull. Geological Research Development Centre (GRDC) 1, p. 47-60.

Indonesia-Japan Joint Research Team (1979)- Stratigraphy and geological structure in the Central Part of the Sangiran Dome. Bull. Geological Research Development Centre (GRDC) 2, p. 55-61.
(Brief description of Late Pliocene- Pleistocene stratigraphy exposed in Sangiran Dome, C Java. Structure is dome, with radial and concentric faults. With four mud volcanoes with exotic blocks and some natural gas seepage. Described in more detail in Watanabe & Kadar, 1985)

Indonesia-Japan Joint Study Team (1991)- Quaternary geology of the northern foot area of Mount Lawu and along the middle course of the Solo river, Central and East Java. Geological Research Development Centre (GRDC), Bandung, p. 1-84.

Indonesia-Japan Joint Study Team (1990)- Stratigraphical correlation of the Quaternary system in the Sangiran area and its surroundings, Central Java. United Nations, CCOP, Technical Bulletin 21, p. 117-134.

Indriati, E. (2004)- Indonesian fossil hominid discoveries from 1889 to 2003: catalogue and problems. In: S. Akiyama et al. (eds.) Proc. Fifth and Sixth Symposia on collection building and natural history studies in Asia and the Pacific Rim, National Science Museum, Tokyo, Monograph 24, p. 163-177.
(Indonesian hominid fossil discoveries catalogue in 1975 listed 57 hominids, in 2003 list more than doubled, albeit lacking provenance for some discoveries)

Indriati, E. & S.C. Anton (2008)- Earliest Indonesian facial and dental remains from Sangiran, Java: a description of Sangiran 27. Anthropological Science 116, 3, p. 219-229.
(online at: https://www.jstage.jst.go.jp/article/ase/116/3/116_070814/_pdf)
(Sangiran 27 only known facial skeleton of Homo erectus. Probably from earliest Pleistocene Sangiran (Pucangan) Fm. Highly mineralized. Ar/Ar dates on bracketing tuffs suggest age of 1.58-1.66 Ma. Sangiran 27 best considered member of H. erectus, but more robust morphology than contemporaneous fossils from Georgia and Kenya)

Indriati, E., C.C. Swisher, C. Lepre, R.L. Quinn, R.A. Suriyanto, A.T. Hascaryo, R. Grun, C.S. Feibel et al. (2011)- The age of the 20 meter Solo River terrace, Java, Indonesia and the survival of *Homo erectus* in Asia. PloS One 6, 6, e21562, p. 1-10.
(online at: www.plosone.org/article/info:doi%2F10.1371%2Fjournal.pone.0021562)
(Wide range and conflicting results of radiometric ages for hominid-bearing beds of Solo River 20m terrace deposits in E Java. New radiometric ages suggest older age than currently accepted. Ar/Ar ages from '20m terrace' at Ngandong and Jigar 546 ± 12 ka, but ESR/U-series results 143 ka± 20 ka, possibly indicating leaching of uranium (N.B.: Rizal et al. (2019) suggest most likely age of bone bed is ~117-108 ka))

Ingicco, T. (2010)- Les primates quaternaires de Song Terus (Java Est, Indonesie): implications paleobiogeographiques et archeozoologiques pour l'Asie du Sud-Est. Doct. Thesis Museum National Histoire Naturelle, Paris, p. 1-281.
('The Quaternary primates of Song Terus (East Java, Indonesia): paleobiogeographic and archeozoological implications for SE Asia'. Bones of non-human primates 70% of E Holocene mammal remains in caves in Punung region of SE Java. Facial parts of monkeys found with pre-Neolithic human burials, as noted by Van Heekeren. Primate speciation patterns in islands of SE Asia suggest continuous connections between Sunda Islands through forested terrain during Pleistocene. Tooth micro-wear suggests commensalism between monkeys (especially Trachypithecus auratus) and humans at SongTerus from 9000-5000 years ago)

Ingicco, T. (2012)- Les primates quaternaires de Song Terus (Java Est, Indonesie): implications paleobiogeographiques et archeozoologiques pour l'Asie du Sud-Est. Bulletins Memoires Societe Anthropologie de Paris 24, p. 199-203.
(Summary of thesis above)

Ingicco, T., N. Amano, K. Setiagama, A.M. Moigne, Budiman, A.M. Semah, T. Simanjuntak & F. Semah (2020)- From food to grave good, Nonhuman primate exploitation in Early to Mid-Holocene Eastern Java (Indonesia). Current Anthropology 61, 2, p. 264-276.
(online at: https://www.researchgate.net/publication/340390122_From_Food_to_Grave_Good_Non-human_Primate_Exploitation_in_Early_to_Mid-Holocene_Eastern_Java_Indonesia)
(On exploitation of Cercopithecidae (monkeys) by E Holocene humans, from acquisition through processing, in two cave sites in Gunung Sewu region of E Java: Song Terus and Braholo. Trachypithecus auratus accounts for more than 90% of monkey remains, suggesting deliberate targeting of this over other monkey species. Placement of butchery marks allowed reconstruction of how monkeys were processed (for food and materials for tool and ornament manufacture))

Ingicco, T., J. de Vos & O.F. Huffman (2014)- The oldest gibbon fossil (Hylobatidae) from insular Southeast Asia; evidence from Trinil (East Java, Indonesia), lower/middle Pleistocene. PloS One 9, 6, E99531, p. 1-15.
(online at: http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0099531)
(Fossil femur excavated by Dubois in 1891-1900 in E-M Pleistocene bone bed of Trinil and now in Dubois collection at Naturalis museum, Leiden, recognized here as that of Hylobatidae (gibbon), making it oldest insular record in SE Asia. Living Hylobatidae inhabit evergreen rain forests, so paleoenvironment in greater Trinil area included forests of this kind in E-M Pleistocene)

(manuscript online at: https://ro.uow.edu.au/cgi/viewcontent.cgi?article=6441&context=smhpapers)
(Excavations at Kalinga in Cagayan Valley of N. Luzon since 2013 yielded 57 stone-tools associated with 75% complete disarticulated skeleton of Rhinoceros philippinensis, with clear signs of butchery, together with other fossil fauna. All finds originate from clayey bone bed dated to 777k- 631k years ago using electron-spin resonance method of tooth enamel and fluvial quartz. This pushes back proven period of hominid colonization of Philippines by 100,000s of years. Basal Unit F bone bed was channel filled up to 3.25m thick mudflow, which covered bones, along with in situ tektite and 57 stone-tools and sparse fossils of other animals (Geoemydidae, Varanus cf. salvator, Stegodon cf. luzonensis, Cervus))

Kaifu, Y., F. Aziz & H. Baba (2005)- Hominid mandibular remains from Sangiran: 1952-1986 collection. American J. Physical Anthropology 128, 3, p. 497-519.
(Descriptions of 8 hominid mandibular and associated dental remains found between 1952 and 1986 in E Pleistocene deposits of Sangiran, C Java. All specimens are surface finds)

Kaifu, Y., F. Aziz & H. Baba (2013)- The origins and early evolution of Indonesian *Homo erectus*: evidence from Sangiran. In: F. Aziz & H. Baba (eds.) *Homo erectus* in Indonesian- Recent progress of the study and current understanding, Centre for Geological Survey, Bandung, Special Publ., Chapter 3, p. 43-64.
(Significant morphological variation and changes within early Homo erectus from Java)

Kaifu, Y., F. Aziz, E. Indriati, T. Jacob, I. Kurniawan & H. Baba (2008)- Cranial morphology of Javanese *Homo erectus*: new evidence for continuous evolution, specialization, and terminal extinction. J. Human Evolution 55, 4, p. 551-580.
(Morphological changes in H. erectus skulls from Java: brain size expansion, anteroposterior lengthening of midcranial base and an anterior shift of posterior temporal muscle, etc. Crania from Sambungmacan transitional between earlier (Bapang Fm above Grenzbank in Sangiran) and later (Ngandong) morphotypes of Java. Development of unique features in later Javanese H. erectus supports hypothesis that this Javanese lineage went extinct without making significant contributions to ancestry of modern humans)

Kaifu, Y., H. Baba & F. Aziz (2006)- Indonesian *Homo erectus* and modern human origins in Australasia; new evidence from the Sambungmacan region, central Java. In: Y. Tomida et al. (eds.) Proc. 7th and 8th Symposium Collection building and natural history studies in Asia and the Pacific Rim, National Science Museum, Tokyo, Monograph 34, p. 289-294.

(online at: https://www.kahaku.go.jp/research/researcher/papers/28135.pdf)
(Fossil and genetic studies generally support African origins of modern humans. Current fossil evidence still insufficient to reject competing claim of continuity between Javanese Homo erectus and modern aboriginal Australians. New H. erectus fossils from Sambungmacan, C Java, intermediate between earlier and later groups of Javanese H. erectus and support discontinuity between H. erectus and H. sapiens in Australasia)

Kaifu, Y., H. Baba & F. Aziz (2013)- Conclusions: current understanding of Indonesian *Homo erectus*. In: F. Aziz & H. Baba (eds.) *Homo erectus* in Indonesian- Recent progress of the study and current understanding, Centre for Geological Survey, Bandung, Special Publ., chapter 6, p. 103-106.
(Earliest Indonesian hominins (Sangiran Grenzbank, Mojokerto, Trinil?) more primimitive than generally thought. Within global hominin context most comparable to Homo ergaster (~1.7-1.5 Ma). Younger E Pleistocene forms (Homo erectus/Bapang-AG) with evolving characteristics towards Late Pleistocene H. erectus/Ngandong (formerly Homo soloensis). Homo erectus unlikely ancestor of Homo sapiens)

Kaifu, Y., H. Baba, F. Aziz, E. Indriati, F. Schrenk & T. Jacob (2003)- Taxonomic affinities and evolutionary history of the early Pleistocene hominids of Java: dentognathic evidence. American J. Physical Anthropology 128, 4, p. 709-726.
(Study of teeth of E Pleistocene Javanese hominids from Sangiran show morphological differences between younger and older groups. Primitive aspects of oldest Javanese hominids suggest hominids dispersed into E Eurasia in earlier Early Pleistocene)

Kaifu, Y., H. Baba, T. Sutikna, M.J. Morwood, D. Kubo, E.W. Saptomo, Jatmiko, R. Due Awe & T. Djubiantono (2011)- Craniofacial morphology of *Homo floresiensis*: description, taxonomic affinities, and evolutionary implication. J. Human Evolution 61, p. 644-682.
(Description of LB1/1 Homo floresiensis cranium. Reductive trend in facial skeleton comparable to H. sapiens, but craniometrically different. LB1 most similar to older Homo erectus from Sangiran and Trinil, consistent with hypothesis that H. floresiensis evolved from early Javanese H. erectus with dramatic island dwarfism)

Kaifu, Y., E. Indriati, F. Aziz, I. Kurniawan & H. Baba (2010)- Cranial morphology and variation of the earliest Indonesian hominids. In: C.J. Norton & D.R. Braun (eds.) Asian Paleoanthropology: from Africa to China and beyond, Springer Science, Chapter 11, p. 143-157.
(Previous arguments suggest oldest Indonesian/ Sangiran hominids characterized by cranial robusticity, but hominids highly variable, with both robust and gracile morphotypes. Cranial size, shape and dentognathic morphology of earliest Indonesian hominids comparable to ~1.7 Ma early Homo erectus from E Africa)

Kaifu, Y., M. Izuho & T. Goebel (2015)- Modern human dispersal and behavior in Palaeolithic Asia: summary and discussion. In: Y. Kaifu et al. (eds.) Emergence and diversity of modern human behavior in Paleolithic Asia, Texas A&M University Press, College Station, p. 535-566.

Kaifu, Y., R.T. Kono, T. Sutikna, E.W. Saptomo, Jatmiko & R. Due Awe (2015)- Unique dental morphology of *Homo floresiensis* and its evolutionary implications. PLoS One 10, 11, e0141614, p. 1-27.
(online at: http://journals.plos.org/plosone/article?id=10.1371/journal.pone.0141614)
(Dental remains of Homo floresiensis both primitive and advanced molar morphologies, a combination unknown in other hominin species. Consistent with alternative hypothesis that H. floresiensis derived from earlier Asian Homo erectus population and experienced size dwarfism in isolated insular setting)

Kaifu, Y., I. Kurniawan, D. Kubo, E. Sudiyabudi, G.P. Putro, E. Prasanti, F. Aziz & H. Baba (2015)- *Homo erectus* calvaria from Ngawi (Java) and its evolutionary implications. Anthropological Science 123, 3, p. 161-176.
(online at: https://www.jstage.jst.go.jp/article/ase/123/3/123_150702/_pdf)
(Endocranial volume of Ngawi 1 skull 959 cm3. Homo erectus crania from Ngawi and Sambungmacan generally similar to those of U Pleistocene Ngandong H. erectus, but also features close to terminal Pleistocene Bapang AG Homo erectus from Sangiran)

Kaifu, Y., I. Kurniawan, S. Mizushima, J. Sawada, M. Lague, R. Setiawan, I. Sutisna, U.P. Wibowo et al. (2024)- Early evolution of small body size in *Homo floresiensis*. Nature Communications 15, 6381, p. 1-13.
(online at: https://www.nature.com/articles/s41467-024-50649-7)
(Additional hominin fossils Mata Menge shorter and thinner than type specimen of H. floresiensis dated to ~60,000 years ago, and smaller than any other Plio-Pleistocene adult hominin hitherto reported. Teeth also exceptionally small and similar to early Javanese H. erectus. H. floresiensis lineage most likely evolved from early Asian H. erectus and was long-lasting lineage on Flores since at least ~700,000 years ago.

Kaifu, Y., I. Kurniawan, D. Yurnaldi, R. Setiawan, E. Setiyabudi, H. Insani, M. Takai, Y. Nishioka et al. (2022)- Modern human teeth unearthed from below the ~128,000-year-old level at Punung, Java: a case highlighting the problem of recent intrusion in cave sediments. J. Human Evolution 163, p. 103-122.
(Late Pleistocene paleontological site of Punung III, East Java, demonstrates how unexpected intrusion of recent human remains into older stratigraphic levels could occur in cave sediments)

Kaifu, Y., E. Setiyabudi, I. Kurniawan, H. Baba & F. Aziz (2013)- Evolution of Indonesian *Homo erectus* in the Early Pleistocene: significance of Sangiran 17. In: F. Aziz & H. Baba (eds.) *Homo erectus* in Indonesian- Recent progress of the study and current understanding, Centre for Geological Survey, Bandung, Special Publ., chapter 4, p. 65-91.
(Sangiran 17, discovered in situ in Bapang Fm in Sangiran in 1969, is best-preserved cranial specimen of Homo erectus. Some of its features transitional to younger Ngandong Homo soloensis, most others similar to Sangiran Bapang AG Homo erectus group)

Kaifu, Y., Y. Zaim, H. Baba, I. Kurniawan, D. Kubo, Y. Rizal, J. Arif & F. Aziz (2011)- New reconstruction and morphological description of a *Homo erectus* cranium: skull IX (Tjg-1993.05) from Sangiran, Central Java. J. Human Evolution 61, 3, p. 270-294.
(New reconstruction of remarkably complete skull of E Pleistocene Homo erectus skull IX (Tjg-1993.05) from Bapang Fm-AG levels in Sangiran (second best preserved cranium of H. erectus ever). Endocranial volume measured as 870 cc. Neurocranium slightly smaller than smallest cranium found earlier, suggesting individual was female. Numerous similarities to other Bapang-AG Homo erectus specimens)

Karl, H.V. (1983)- Die fossilen Schildkroten von Jawa in den Sammlungen des Paläontologischen Museums im Museum fur Naturkunde Berlin. Unpublished Report, Museum fur Naturkunde; Berlin, p.

Martin, R.D., A.M. MacLarnon, J.L. Phillips & W.B. Dobyns (2006)- Flores hominid: new species or microcephalic dwarf ? The Anatomical Record, A, 288A, 11, p. 1123-1145.
(online at: http://onlinelibrary.wiley.com/doi/10.1002/ar.a.20389/pdf)
(New hominids 'Homo floresiensis' from Flore, dated at ~18,000 yrs, very small but dentally adult. Commonly interpreted as insular dwarf derived from Homo erectus, but far too small to derive from Homo erectus by normal dwarfing. H. floresiensis most likely microcephalic Homo sapiens with advanced stone tools)

Marwick, B., C. Clarkson, S. O'Connor & S. Collins (2016)- Early modern human lithic technology from Jerimalai, East Timor. J. Human Evolution 101, p. 45-64.
(Jerimalai rock shelter in E Timor with large assemblage of Pleistocene stone artefacts and shell fish hooks dated to 42,000 yrs BP, one of oldest known sites of modern human activity in island SE Asia. Little change in lithic technology over 42,000 year sequence until addition of new types and raw materials in M Holocene. Assemblage dominated by small chert cores and implements rather than pebble tools and choppers (common in island SE Asia as opposed to mainland SE Asia). Jerimalai assemblage resembles Liang Bua assemblage of Flores, associated with Homo floresiensis; both possibly created by modern humans)

Matsumura, H. (2000)- Origins of Southeast Asian people as viewed from cranial and dental morphology. Asian Paleoprimatology, Kyoto, 1, p. 149-160.
(online at: https://core.ac.uk/download/pdf/39322992.pdf)
(Human skeletons of Hoabinian (late Pleistocene- E Holocene) from Malaysia, Indonesia and Vietnam demonstrate Australo-Melanesian- affinity cranial and dental morphology. These were members of population that appeared in late Pleistocene Sundaland, and ancestors of modern Australian Aborigines. Subsequent Neolithic to modern populations in SE Asia have dental and cranial characteristics more similar to modern N and E Asians, suggesting migrants from Asia mainland (China?) expanded into its peninsula and island regions of SE Asia since Neolithic, supporting the "dual ancestry hypothesis" for SE Asia population history)

(online at: https://www.library.uq.edu.au/ojs/index.php/aa/article/download/996/994)
(1994 excavation in fluvial Ola Bula Fm at Mata Menge near Bajawa, C Flores, yielded M Pleistocene stone tool pieces (basalt and chert flakes) and faunal remains (large Stegodon, crocodile, giant rat). Likely Matuyama-Brunhes boundary (and tektites from same site reported by Maringer and Verhoeven 1970 (but below main fossil layers?))

Morwood, M.J., P. Brown, Jatmiko, T. Sutikna, E. Wahyu Saptomo, K.E. Westaway, R. Awe Due et al. (2005)- Further evidence for small-bodied hominins from the late Pleistocene of Flores, Indonesia. Nature 437, 7061, p. 1012-1017.

(Homo floresiensis from Late Pleistocene of Flores has stature, limb proportions and endocranial volume of African Pliocene Australopithecus. Age of population from 95-74 to 12 thousand years ago. Excavation yielded more evidence for behavioural capabilities, including butchery of Stegodon and use of fire)

Morley, R.J., H.P. Morley, Y. Zaim & O.F. Huffman (2020)- Palaeoenvironmental setting of Mojokerto *Homo erectus*, the palynological expressions of Pleistocene marine deltas, open grasslands and volcanic mountains in East Java. J. of Biogeography 47, 3, p. 566-583.
(online at: www.researchgate.net/publication/338691956_Palaeoenvironmental_setting_of_Mojokerto Etc.)
(Facies in Perning and Jetis sections near Mojokerto indicate landscape with four potential Homo habitats: muddy deltas with widespread Nypa swamps; poorly vegetated sandy delta; open savanna grasslands in lowlands up river of delta; and volcanoes in upper reaches of catchment with perhumid montane podocarp and broad-leaf forests and probable open fire-climax Casuarina junghuhniana forest. Palynological data support Early Pleistocene geological age for Mojokerto H. erectus at about 1.43 Ma)

Morwood, M.J. & W.L. Jungers (eds.) (2009)- Paleoanthropological research at Liang Bua, Flores, Indonesia. J. Human Evolution 57, 5, p. 437-648.
(Collection of papers of Flores studies)

Morwood, M.J. & W.L. Jungers (2009)- Conclusions: implications of the Liang Bua excavations for hominin evolution and biogeography. J. Human Evolution 57, 5, p. 640-648.
(Liang Bua excavations on Flores stratified sequence of stone artifacts and faunal remains spanning ~95- 17 ka, and includes skeletal remains of Homo sapiens in Holocene and Homo floresiensis in Pleistocene. Small H. floresiensis not australopithecine and not dwarfing of ancestral H. erectus population, but probably late representative of small-bodied hominid lineage that exited Africa before emergence of Homo erectus)

Morwood, M.J., P.B. O'Sullivan, F. Aziz & A. Raza (1998)- Fission-track ages of stone tools and fossils on the East Indonesian island of Flores. Nature 392, p. 173-176.
(Zircon fission-track dates from two fossil sites on Flores. Tangi Talo, with endemic fauna, dates to 0.90 ± 0.07 Ma, Mata Menge (with stone tools and elements of continental SE Asian fauna) 0.88- 0.80 Ma. Also older, reworked zircons with ages between 7 and 14 Ma (also with Australasian tektites; Von Koenigswald 1957))

Morwood, M.J., P. O'Sullivan, E.E. Susanto & F. Aziz (2003)- Revised age for Mojokerto 1, an early *Homo erectus* cranium from East Java, Indonesia. Australian Archaeology 57, p. 1-4.
(online at: www.library.uq.edu.au/ojs/index.php/aa/article/viewFile/526/1690)
(Field study and redating of two pumice horizons at site of Homo erectus skull found by Duyfjes (1936) at Mojokerto, E Java, indicates age is <1.49 Ma, not much-hyped 1.8 Ma age of Swisher et al. (1984))

Morwood, M.J., R.P. Soejono, R.G. Roberts, T. Sutikna, C.S.M. Turney, K.E. Westaway et al. (2004)- Archaeology and age of a new hominin from Flores in eastern Indonesia. Nature 431, p. 1087-1091.
(Excavations at Liang Bua cave on Flores yielded tiny hominins, assigned to Homo floresiensis n.sp. It existed from before 38 ka until at least 18 ka. Associated deposits contain stone artefacts and animal remains, including Komodo dragon and endemic, dwarfed species of Stegodon. Homo floresiensis originated from early dispersal of Homo erectus and overlapped in time with Homo sapiens in region)

Morwood, M.J., T. Sutikna, E.W. Saptomo, K.E. Westaway, Jatmiko et al. (2008)- Climate, people and faunal succession on Java, Indonesia: evidence from Song Gupuh. J. Archaeological Science 35, 7, p. 1776-1789.
(Song Gupuh cave in Gunung Sewu Limestones, E Java, over 16m of deposits with faunal sequence spanning 70 ka. Terminal Pleistocene- Early Holocene period of maximum biodiversity. Human activity, especially after onset of Neolithic around 2.6 ka, contributed to progressive loss of species from area)

Morwood, M.J. & P. van Oosterzee (2007)- A new human- The startling discovery and strange story of the "hobbits" of Flores, Indonesia. Harper Collins, p. 1-222.
(Popular book on 2004 discovery of Homo floresiensis and its interpretation as a new species. N.B.: There is a school of paleoanthropologists that still dispute this 'startling discovery; see e.g. Jacob et al. (2006), Martin et

al. (2006), Bednarik (2008), Obendorf et al. (2008), Oxnard et al. 2010, Henneberg et al. (2011), Eckhardt et al. (2014) and others, who argue Morwood et al. misrepresented facts and misinterpreted significance of H. floresiensis, which they believe represents aberrant specimens of Homo sapiens)

Roberts, P. & N. Amano (2019)- Plastic pioneers: hominin biogeography east of the Movius Line during the Pleistocene. Archaeological Research in Asia 17, p. 181-192.
(online at: https://os.pennds.org/archaeobib_filestore/pdf_articles/ArchRAsia/2019_RobertsAmano.pdf)
(E-M Pleistocene Homo erectus and its diminutive descendant(?) Homo floresiensis, was able to move East of the (now defunct) 'Movius Line' and the biogeographic Wallace Line. Migration followed alongside woodland- and grassland-adapted fauna, with some evidence for use of lacustrine and riverine tropical forest settings. By contrast, Homo sapiens, appeared in SE Asia during expansion of rainforest fauna (like today) and adapted to a diversity of tropical rainforest settings. It also developed specialized maritime subsistence strategies that aided its rapid expansion beyond the Wallace Line and Sahul since 45 ka or earlier)

Roberts, P., J. Louys, J. Zech, C. Shipton, S. Kealy, S.S. Carro, S. Hawkins, C. Boulanger et al. (2020)- Isotopic evidence for initial coastal colonization and subsequent diversification in the human occupation of Wallacea. Nature Communications 11, 2068, p. 1-11.
(online at: https://www.nature.com/articles/s41467-020-15969-4.pdf)
(Stable carbon and oxygen isotope analysis of human and faunal tooth enamel reflect diets. Earliest humans to arrive in Wallacea (E Indonesia archipelago) seemingly specialized in use of coastal-marine resources. Rapid initial coastal colonization followed by inland settlement. After 20,000 years BP, diversification in human resource use across Wallacea. On Timor, tropical forest environments remained prevalent in past 45,000 years)

Roberts, R.G., K.E. Westaway, J.X. Zhao, C.S.M.Turney, M.I. Bird, W.J. Rink & L.K. Fifield (2009)- Geochronology of cave deposits in Liang Bua and of adjacent river terraces in the Wae Racang valley, western

Flores, Indonesia: a synthesis of age estimates for the type locality of *Homo floresiensis*. J. Human Evolution 57, 5, p. 484-502.

Suryatman, R.R. Triwurjani, S. Adhityatama, D. Bulbeck, D. Yurnaldi, A. Murdihastomo, J. Wahyudiono, Abdullah & M.D.K. Dhony (2021)- Flaking stone activity in the tradition of iron smelting from the 8th to 17th centuries AD in the Matano region, South Sulawesi, Indonesia. J. Archaeological Science: Reports 36, 102817, p. 1-12.
(online at: https://archaeobib.iseaarchaeology.org/files/original/4a3b3b4241d9db83aaa35e4fc6f8ccc0.pdf)
(New iron smelting sites in Lake Matano region, E Sulawesi (NE of S Sulawesi provicnce), including submerged sites. Belonging to iron-smelting industry developed here in 8th-17th centuries AD. Thousands of chert artifacts excavated from Rahumpu'u lakeshore site were used as strike-a-lights for combustion of fuel for iron smelting. Flaking chert was one of skills possessed by Matano indigenous iron smelters,to produce high quality iron)

Sutikna, T. (2016)- New archaeological research at Liang Bua on the island of Flores: implications for the extinction of *Homo floresiensis* and the arrival of *Homo sapiens* in eastern Indonesia. Ph.D. Thesis, School of Earth and Environmental Sciences, University of Wollongong, p. 1-206.
(online at: https://ro.uow.edu.au/theses/4745/)
(Series of new excavations at Liang Bua, Flores, between 2007 and 2014 led to new interpretation of time of H. floresiensis extinction (~50 ka) and H. sapiens arrival (~46 ka) (no longer necessarily overlap in age))

Sutikna, T., M.W. Tocheri, J.T. Faith, R.D. Awe, H.J. Meijer, E.W. Saptomo & R.G. Roberts (2018)- The spatio-temporal distribution of archaeological and faunal finds at Liang Bua (Flores, Indonesia) in light of the revised chronology for *Homo floresiensis*. J. Human Evolution 124, 52e74, p. 52-74.
(online at: https://www.sciencedirect.com/science/article/pii/S0047248417303160)
(Liang Bua limestone cave in Flores is, the type site of Homo floresiensis. Sdimentary deposits range from ~190 ka to present. Skeletal remains of H. floresiensis ~100-60 ka old; cultural evidence until ~50 ka. Major shifts in faunal and stone artifacts reflect marked changes in paleoecology and hominin behavior. H. floresiensis and Stegodon florensis insularis, along with giant marabou stork and vulture, likely extinct by ~50 ka. Increased use of chert occurs at ~46 ka may characterize Homo sapiens assemblages at Liang Bua)

Sutikna, T., M.W. Tocheri, M.J. Morwood, E.W. Saptomo, Jatmiko, R.D. Awe, Sri Wasisto, K.E. Westaway, M. Aubert et al. (2016)- Revised stratigraphy and chronology for *Homo floresiensis* at Liang Bua in Indonesia. Nature 532, 7599, p. 366-369.
(online at: www.academia.edu/23978420/Revised_stratigraphy_and_chronology_for_Homo_floresiensis_Etc.)
(Skeletal remains and deposits with H. floresiensis dated as 100- 60 ka. Stone artefacts range from ~190-50 ka. Not clear if H. floresiensis survived after 50 ka and potentially encountered modern humans on Flores or other hominins dispersing through SE Asia)

Suyanto A. & C.H.S. Watts (2002)- Verhoeven's giant rat of Flores, Indonesia (*Papagomys theodorverhoeveni* Musser, 1981; Muridae) is a modern species. Treubia 32, 1, p. 87-93.

(online at: http://ejournal.anu.edu.au/index.php/bippa/article/view/425/414)
(Relation of Java mammal faunal changes in last 2.5 My to global sea level changes not clear. No proof for presence of mammals on Java during first marked glacio-eustatic sea level lowering at 2.4 Ma. Oldest recognizable fauna is Satir fauna, age between 2- 1.5 Ma and indicates island conditions. Isolated conditions continue until ~0.8 Ma, suggested by unbalanced Ci Saat (1.2 Ma) and Trinil faunas (0.9 Ma), when Homo erectus arrived. Major faunal immigration at 0.8 Ma with Kedung Brubus fauna, corresponding with marked lowering of glacio-eustatic sea level)

Van Den Bergh, G.D., R. Due Awe, M.J. Morwood, T. Sutikna, Jatmiko & E.W.Saptomo (2008)- The youngest *Stegodon* remains in Southeast Asia from the Late Pleistocene archaeological site Liang Bua, Flores, Indonesia. Quaternary International 182, p. 16-48.
(online at: www.academia.edu/18237457/The_youngest_stegodon_remains_in_Southeast_Asia_from Etc.)
(Stegodon remains from Late Pleistocene of Liang Bua cave, NW Flores, described as new endemic dwarf subspecies: Stegodon florensis insularis. Hominin activities likely played role in Stegodon bone accumulation at cave. Disappearance of Stegodon from Liang Bua sequence coincides with tuff layer in cave around 11 ka)

Van Den Bergh, G.D., Y. Kaifu, I. Kurniawan, R.T. Kono, A. Brumm, E. Setiyabudi, F. Aziz & M.J. Morwood (2016)- *Homo floresiensis*-like fossils from the early Middle Pleistocene of Flores. Nature 534, 7606, p. 245-248.
(online at: http://udel.edu/~mcdonald/vandenbergh2016.pdf)
(Hominin fossils excavated in 2014 from early M Pleistocene Mata Menge site, Soa Basin, C Flores, include mandible fragment and isolated teeth, similar to Late Pleistocene H. floresiensis of Liang Bua cave. Dated as ~0.7Ma, oldest known hominin remains from Flores. Mata Menge fossils tend to support view that H. floresiensis is dwarfed descendent of early Asian Homo erectus)

Van Den Bergh, G.D., I. Kurniawan, M.J. Morwood, C.J. Lentfer, Suyono, R. Setiawan & F. Aziz (2009)- Environmental reconstruction of the Middle Pleistocene archaeological/ palaeontological site Mata Menge, Central Flores, Indonesia. In: F. Aziz et al. (eds.) Geology, palaeontology and archaeology of the Pleistocene Soa Basin, Central Flores, Indonesia, Chapter 4, Pusat Survei Geologi, Bandung, Special Publ. 36, p. 59-94.
(M Pleistocene paleontological- archeological Mata Menge site in Soa basin represents lake shore deposits, aged ~0.80- 0.88 Ma. Common Stegodon florensis bones from aged animals that probably died natural death. Despite abundance of stone artefacts in same layers no evidence for butchering. FT age of overlying white tuff 0.75 ± 0.07 Ma (Morwood et al. 1998). Fossils all in 0.5- 1.3m thick 'Unit B'; overlying Unit C tuffaceous siltstone and sand unfossiliferous)

Van den Bergh, G.D., Bo Li, A. Brumm, R. Grun, D. Yurnaldi, M.W. Moore, I. Kurniawan, R. Setiawan, F. Aziz, R.G. Roberts, Suyono, M. Storey, E. Setiabudi & M.J. Morwood (2016)- Earliest hominin occupation of Sulawesi, Indonesia. Nature 529, 7585, p. 208-211.
(online at: https://www.academia.edu/26879805/Earliest_hominin_occupation_of_Sulawesi_Indonesia)
(New excavations at Talepu in Walanae Basin, NE of Maros, with hominid stone artefacts and fossil megafauna (Bubalus, Stegodon, Celebochoerus) from sediments deposited from before 200 ka until ~100ka)

Van den Bergh, G.D., H.J.M. Meijer, R.A. Due, M.J. Morwood, K. Szabo, L.W. van den Hoek Ostende, T. Sutikna, E.W. Saptomo, P.J. Piper & K.M. Dobney (2009)- The Liang Bua faunal remains: a 95 k.yr. sequence from Flores, East Indonesia. J. Human Evolution 57, 5, p. 527-537.
(online at: www.academia.edu/18237450/The_Liang_Bua_faunal_remains_a_95k_yr_sequence_from_F Etc.)
(Excavations at Liang Bua limestone cave on Flores faunal sequence spanning the last 95 ky. Major climatic fluctuations, and two human species: (1) H. floresiensis from 95- 17 ka, and (2) modern humans from 11 ka-Present. Faunal assemblage comprises island gigantism in small mammals and dwarfing of large taxa. Confirms long-term isolation, impoverishment, and phylogenetic continuity of Flores faunal community)

Van den Bergh, G.D., B. Mubroto, F. Aziz, P.Y. Sondaar & J. de Vos (1996)- Did *Homo erectus* reach the island of Flores? In: P. Belwood (ed.) Bull. Indo-Pacific Prehistory Association (IPPA) 14 (Chiang Mai Papers- 1), p. 27-34.
(online at: https://journals.lib.washington.edu/index.php/BIPPA/article/view/11585)
(Primitive E- M Pleistocene stone artifacts from Ola Bula Fm near Mata Menge, Central Flores (first discovered by T. Verhoeven in 1956), too old for Homo sapiens, probably made by Homo erectus)

Van den Bergh, G.D., P.Y. Sondaar, J. de Vos & F. Aziz (1996)- The Proboscideans of the South-East Asian islands. In: J. Shoshani & P. Tassy (eds.) The Proboscidea; evolution and palaeoecology of elephants and their relatives, Oxford University Press, chapter 23, p. 240-248.
(Present-day elephants are excellent swimmers. Presence of Pleistocene fossil proboscidean remains on several islands surrounded by deep seas suggests they crossed sea barriers. Proboscideans rel. common in fossil impoverished endemic island faunas, sometimes as the only large mammal. In the Lesser Sunda Arc, only Stegodontidae reported as large mammals on islands Flores, Sumba, and Timor)

Van den Bergh, G.D., U. P. Wibowo, E. Setiyabudi, I. Kurniawan, M. Storey, I.Y.P. Suharyogo & M. Puspaningrum (2019)- The Early Pleistocene terrestrial vertebrate faunal sequence of Java, Indonesia. 79th Annual Meeting Society of Vertebrate Paleontology (SVP), Brisbane 2019, 1p. *(Poster)*
(online at: www.researchgate.net/publication/340984466_The_Early_Pleistocene_terrestrial_vertebrate_faunal_sequence_of_Java_Indonesia)
(Summary of work on oldest mammal-bearing beds in Java, the 575m thick Kali Glagah Fm near hamlets Satir and Cisaat, Bumiayu, largely corroborating 1925-1930 and later work. KGF overlies shallow marine Kali Biuk Fm and is overlain by volcanoclastic Mengger Fm. 39Ar/40Ar dating on hornblendes from pumice clast inMengger Fm 1.53 ± 0.08 Ma (providing minimum age for KGF mammal assemblages). Max. age of basal KGF 2.14 Myr, based on published paleomagnetic work. Oldest mammal fauna on Java is Satir Fauna, from basal 50m of KGF, with age estimated at 2 Ma. Satir Fauna succeeded by Ci Saat composite "fauna", based on scattered finds from middle and upper fluvial KGF)

(Review of research works on 'Java Man' by Dubois, Von Koenigswald, etc.)

Weidenreich, F. (1945)- Giant early man from Java and South China. American Museum Natural History Anthropological Papers 40, 1, p. 5-134.
(online at: digitallibrary.amnh.org/handle/2246/263)
(Discussion of unusually large hominids (Pithecanthropus robustus Weidenreich from China, Meganthropus palaeojavanicus from Sangiran, Java). Partly based on unpublished material from Von Koenigswald)

Weidenreich, F. (1951)- Morphology of Solo man. Anthropological Papers American Museum Natural History 43, 3, p. 203-288.
(online at: http://digitallibrary.amnh.org/handle/2246/297)
(Description of 11 skulls of Homo soloensis, collected between 1931 and 1941 from Late Pleistocene Solo river 20m terrace at Ngandong, left bank of Solo River, 6 miles N of Ngawi, C Java. Associated with rich mammalian fauna (Sus terhaari, Cervus javanicus) and possible bone tools and stone balls. Hominins believed to be younger than those from other parts of Java (Sangiran, Mojokerto, Trinil). Remarkable absence of other hominin body parts. With introduction by Von Koenigswald on geology and associated fauna (NB: unfinished study due to Weidenreich's death in 1948; see also Santa Luca 1980))

Weinand, D.C. (2005)- A reeevaluation of the paleoenvironmental reconstructions associated with *Homo erectus* from Java, Indonesia, based on the functional morphology of fossil bovid Astragali. Ph.D. Thesis University of Tennessee, p. 1-173.
(online at: https://trace.tennessee.edu/utk_graddiss/2315)
(Study of bovid astragali ('cow knuckle bones') from hominid-bearing sites in Java indicate paleoenvironment at Trinil site (~1 Ma) dominated by vegetated river valleys and upland forests, broken by grasslands. Grasslands probably expanded at time of Kedung Brubus locality (~0.8 Ma). Environmental change and immigration of new species important to evolutionary success of Homo erectus in M Pleistocene)

Westaway, K.E. (2006)- Reconstructing the Quatermary landscape evolution of Western Flores: an environmental and chronological context for an archaeological site. Ph.D. Thesis University of Wollongong, p. 1-411.
(online at: http://ro.uow.edu.au/theses/562/)
(Age range for occupation of Liang Bua cave by Homo floresiensis 95-11 ka, most intensive phases of occupation 74-61 and 17-11 ka, depositional age of holotype skeleton 36-14 ka, and age of oldest human skeletal remains found on Flores 95-74 ka)

Westaway, K.E. & C.P. Groves (2009)- The mark of ancient Java is on none of them. Archaeology in Oceania 44, 2, p. 84-95.
(Suggested links between Javanese E Pleistocene Homo erectus and Australian Late Pleistocene Homo sapiens crania (Thorne, etc.) questionable. Hybridization of two species unlikely: no chronological overlap and phylogenetic analysis indicate no close genetic relationship between Ngandong-like population from Java and late Pleistocene Australian fossils from Willandra Lakes)

Westaway, K.E., J. Louys, R. Due Awe, M.J. Morwood, G J. Price, J.X. Zhao, M. Aubert, R. Joannes-Boyau, T.M. Smith et al. (2017)- An early modern human presence in Sumatra 73,000-63,000 years ago. Nature 548, 7667, p. 322-325. *(online at: www.academia.edu/39125826/An_early_modern_human_presence_in_Sumatra_73_000_63_000_years_ago)*
(Reinvestgation of Lida Ajer cave in Padang Highlands, W Sumatra, which yielded Late Pleistocene human teeth (Dubois 1890), associated with rich rainforest fauna. Enamel-dentine junction morphology, enamel thickness and comparative morphology show teeth belong to anatomically modern humans (Homo sapiens). Dating of bone-bearing sediments and U-series/ electron spin resonance dating of Pongo mammalian teeth place modern humans in Sumatra between 73-63 ka. Evidence of rainforest occupation by H. sapiens at ~70 ka is ~20 ka earlier than assumed timing of dispersal of modern humans across SE Asia)

Westaway, K.E., J.M. Morwood, R.G. Roberts, A.D. Rokus, J.X. Zhao, P. Storm, F. Aziz, G. van den Bergh, P. Hadi, Jatmiko & J. de Vos (2007)- Age and biostratigraphic significance of the Punung rainforest fauna, East Java, Indonesia, and implications for *Pongo* and *Homo*. J. Human Evolution 53, p. 709-717.

(Punung Fauna of Java represents faunal turnover when Stegodon and other archaic mammal species were replaced by modern fauna, including rainforest-dependent species such as Pongo pygmaeus (orangutan). Dated as early Last Interglacial age (between 128±15 and 118±3 ka))

Westaway, K.E., M.J. Morwood, R.G. Roberts, J.X. Zhao, T. Sutikna et al. (2007)- Establishing the time of initial human occupation of Liang Bua, western Flores, Indonesia. In: R. Grun & R.G. Roberts (eds.) 11th Int. Conf. Luminescence and electron spin resonance dating (LED 2005), Quaternary Geochronology 2, p. 337-343.
(Liang Bua limestone cave in W Flores existed as subterranean chamber since 400 ka and has archeological-faunal sequence known to span last 95 ka (type locality for small-bodied hominid Homo floresiensis))

Westaway, K.E., M.J. Morwood, T. Sutikna, M.W. Moore, A.D. Rokus, G.D. van den Bergh, R.G. Roberts & E.W. Saptomo (2009)- *Homo floresiensis* and the late Pleistocene environments of eastern Indonesia: defining the nature of the relationship. Quaternary Science Reviews 28, p. 2897-2912.
(online at: www.academia.edu/466213/Homo_floresiensis_and_the_late_Pleistocene_environments_of Etc.)
(Occupation deposits in Liang Bua limestone cave on Flores span ~95 kyrs and contain abundant stone artefacts, well preserved faunal remains and evidence for endemic hominin Homo floresiensis. H. floresiensis endured rapidly fluctuating environmental conditions over last ~100 ka. Peaks in occupation at 100-95, 74-61 and 18-17 ka correlate with episodes of channel formation and erosion in cave, which in turn correspond with high rainfall, thick soils and high bio-productivity outside)

(online at: https://repository.naturalis.nl/pub/319310)
(Re-description and first illustration of well-preserved Pleistocene emydine freshwater turtle shell from Trinil Beds at Kedoeng Panas, Java (first briefly described by E. Dubois, 1908). Paper questions relation of H. isoclina with Hardella, and prefers assignment to genus Clemmys? isoclina (Dubois) (see also Das (1997))

Wiradnyana, K., T. Setiawan & H. Forestier (2023)- Le Hoabinhien et la reconstruction de la paleogeographie du Nord de Sumatra. L'Anthropologie 127, 3 (Special Issue Prehistoire de l'Indonesie), 103149, p. 1-12.
('The Hoabinhian and the reconstruction of the paleogeography of North Sumatra'. Hoabinhian Late Pleistocene-Holocene stone tool technocomplex in N Sumatra and mainland SE Asia characterized by presence of unifacial pebbles (sumatraliths). In N Sumatra Hoabinhian sites present as shell-middens in coastal areas and in caves in mountainous areas. Recent 14C dating of several Hoabihian sites in N Sumatra show occupation between 12,000- 3,000 years BP)

Witkamp, H. (1920)- Kjokkenmoddinger ter Oostkust van Sumatra. Tijdschrift Koninklijk Nederlandsch Aardrijkskundig Genootschap 37, p. 572–574.
('Shell middens at the East coast of Sumatra'. First report of presence of several large mounds of sea shells, typically 20m wide and 3-5m high, NW of Bindjai in NE Sumatra. These represent 'kitchen waste' of Mesolithic hunter-gatherer peoples. Many of these prehistoric shell mounds have since been destroyed for use as road cover and in local lime kilns. (later archeological excavation work by P. van Stein Callenfels in 1925 was never properly documented; see also Schurmann, 1931; JTvG)

Wolpoff, M.H. (1984)- Evolution in *Homo erectus*: the question of stasis. Paleobiology 10, 4, p. 389-406.

(Analyses of Homo erectus fossils, incl. Indonesian material. Shows evolutionary changes in increased cranial capacity and mandibular and dental features. Late end of H. erectus range difficult to define, as evidenced by difficulty in agreeing on whether Ngandong (C Java) samples are H. erectus or H. soloensis or H. sapiens)

Wolpoff, M.H., A.G. Thome, J. Jelinek & Y. Zhang (1994)- The case for sinking *Homo erectus*. 100 years of *Pithecanthropus* is enough! In: J.L. Franzen (ed.) 4th International Conference 100 years of *Pithecanthropus*. The *Homo erectus* problem, Frankfurt 1991, p. 341-361.
(online at: https://www.researchgate.net/publication/285136980_The_case_for_sinking_Homo_erectus_100_years_of_Pithecanthropus_is_enough)
(Provocative and probably oversimplified hypothesis that Homo erectus and Homo sapiens are parts of single evolving Homo species in past two million years)

Wurster, C.M. & M.I. Bird (2015)- Barriers and bridges: early human dispersals in equatorial SE Asia. In: J. Harff et al. (eds.) Geology and archaeology: submerged landscapes of the continental shelf, Geological Society, London, Special Publ. 411, p. 235-250.
(Review of paleogeography of W Indonesian region during Last Glacial Period. Hominin fossil sites generally associated with areas of open vegetation. N-S savannah corridor probably existed on Sunda Shelf, facilitating rapid dispersal of early humans in SE Asia)

Yabuki, H. & M. Shima (1981)- Fission track age and chemical composition of tektite from the remain of *Pithecanthropus erectus*. Scientific Papers Institute of Physical and Chemical Research (Tokyo) 75, 2, p. 102-104.
(M Pleistocene age determination of tektite from Sangiran, C. Java)

Yokoyama, Y., C. Falgueres, F. Semah, T. Jacob & R. Grun (2008)- Gamma-ray spectrometric dating of late *Homo erectus* skulls from Ngandong and Sambungmacan, Central Java, Indonesia. J. Human Evolution 55, 2, p. 274-277.
(Hominid fossils from Ngandong and Sambungmacan, C Java, Indonesia considered youngest representatives of Homo erectus (but much younger than, and different from, typical Sangiran H. erectus; JTvG). Dating of three skulls established minimum age of ~40 ka, with upper age limit ~60-70 ka. Ages suggest Homo erectus of Java likely survived Toba eruption and was possibly contemporaneous with earliest Homo sapiens in SE Asia)

Yokoyama, T., S. Hadiwisastra, W. Hantoro, T. Matsuda & S. Nishimura (1980)- K-Ar age of the 'Lahar Tuff' lowest part of the Pucangan formation, Pleistocene of Sangiran, Central Java, Indonesia. J. Riset Geologi dan Pertambangan (LIPI) 3, 1, p. 1-7.
(K-Ar age of 2.06 ± 0.6 Ma from andesite from 'Lahar Tuff' of base of Pucangan Fm in W Sangiran Dome. Layer has normal magnetic polarity, maybe correlated with Olduvai Event (1.67-1.87 Ma))

Yokoyama, T. & I. Koizumi (1989)- Marine transgressions on the Pleistocene Pecangan Formation in the Sangiran area, central Java, Indonesia. Palaeogeogr. Palaeoclim. Palaeoecology 72, p. 177-193.
(Paleomagnetic survey, diatoms and electric conductivity suggest four marine transgressions in Pleistocene Pucangan Fm between 1.8- 0.73 Ma, reflecting glacial eustasy. First major transgression at ~1.5 Ma, after the Olduvai Event and next one just before the Jaramillo Event, presumably reflecting glacial eustasy)

Yudha, D.S. (2008)- Reevaluation du crane Ngawi 1 (*Homo erectus*, Java, Indonesie), apports de l'imagerie 3D et des analyses multivariees. Master Thesis Quaternaire et Prehistoire, Museum National Histoire Naturelle, Paris, p. 1-55.
(online at: http://hopsea.mnhn.fr/pc/thesis/M2_DONAN_S_Y.pdf)
('Reevaluation of the Ngawi 1 skull (Homo erectus, Java, Indonesia); 3D imaging and multivariate analyses'. M-L Pleistocene Ngawi 1 skull found in 1987 morphologically close to 'late Homo erectus' Ngandong and Sambungmacan hominids. Morphological characteristics of Ngawi skull not directly comparable to Chinese (Sinanthropus) and African Homo erectus (H. ergaster), but one African individual (Olduvai 9) fits well in Ngandong-Ngawi group)

Yurnaldi, D., R. Setiawan & E.Y. Patriani (2018)- The magnetostratigraphy and the age of So'a Basin fossil-bearing sequence, Flores, Indonesia. Indonesian J. on Geoscience (IJOG) 5, 3, p. 221-234.
(online at: https://ijog.geologi.esdm.go.id/index.php/IJOG/article/view/433/269)
(Three fossil-bearing intervals recognized in Pleistocene Soa Basin of Flores, with upper one holding important hominin fossils. Paleomagnetic sampling of four sections shows two reverse and two normal polarity zones. Reverse magnetozones part of Matuyama Chron, normal magnetozones are Jaramillo and Brunhes chrons. Tangi Talo fossil layer below base Jamarillo, older than previously thought (>1.07 Ma). Mata Menge fossil intervals above Matuyama-Brunhes boundary (<0.78 Ma))

(Eight latest Oligocene- M Miocene larger foram associations in NW Cape Range, off Exmouth Gulf, NW Australia (LF1-LF8; Te- Lower Tf). No Spiroclypeus or Eulepidina observed (but Heterostegina borneensis in LF2. LF1 assemblage with Lacazinella, probably reworked from underlying Eocene Giralia Limestone)

Chaproniere, G.C.H. (1983)- Tertiary larger foraminiferids from the northwestern margin of the Queensland Plateau, Australia. Paleontological papers 1983, Bureau Mineral Resources Geology Geophysics, Bull. 217, p. 31-57.
(online at: https://d28rz98at9flks.cloudfront.net/12/Bull_217.pdf)
(M Eocene Ta3 with Asterocyclina and Latest Oligocene- E Miocene (around Lower Te/ upper Te boundary) larger foram assemblages in dredge samples from~1500-2500m water depth on Queensland Plateau, off Great Barrier Reef, NE Australia)

Chaproniere, G.C.H. (1984)- Oligocene and Miocene larger foraminiferida from Australia and New Zealand. Bureau Mineral Resources Geology Geophysics, Canberra, Bull. 188, p. 1-98.
(online at: https://www.ga.gov.au/products/servlet/controller?event=GEOCAT_DETAILS&catno=15)
(Larger foraminifera from Late Oligocene-M Miocene outcrops in Carnarvon Basin and W Australia; also Ashmore Reef 1 well in Bonaparte Gulf, Gage Roads 2 well in Perth Basin; Batesford and Bochara Lst in Victoria; Wreck Island 1 well in Queensland; and various localities in New Zealand. Two new subspecies of Lepidocyclina (N): Lepidocyclina (N) howchini praehowchini and Lepidocyclina (N) orakeiensis waikukuensis)

Chaproniere, G.C.H. (1984)- The Neogene larger foraminiferal sequence in the Australian and New Zealand regions and its relevance to the East Indies Letter Stage classification. Palaeogeogr. Palaeoclim. Palaeoecology 46, p. 25-35.
(Neogene larger foraminifera in N Australia range from Late Oligocene-earliest M Miocene, in S Australia restricted to late E Miocene. Longer range in New Zealand: Late Oligocene- mid-M Miocene)

Chaproniere, G.C.H. (1992)- The distribution and development of Late Oligocene and Early Miocene reticulate globigerines in Australia. Marine Micropaleontology 18, p. 279-305.
(Globigerinoides represented by both hispid (Gs. primordius) and reticulate (Gs. quadrilobatus) forms at levels below first appearance of Globoquadrina dehiscens (within Zone N4A in N Australia). Globigerinoides quadrilobatus warm, shallow water dweller. Globigerina bulloides group temperate biogeographic range, but typical of upwelling zones in subtropical and tropical areas)

Cheng , Z., J. Wu, C. Luo, Z. Liu, E. Huang, H. Zhao, L. Dai & C. Weng (2023)- Coexistence of savanna and rainforest on the ice-age Sunda Shelf revealed by pollen records from southern South China Sea. Quaternary Science Reviews 301, 107947, p.
(Marine pollen records from southern South China Sea focusing on Late Pleistocene Last Glacial Maximum (LGM) time show that sites in front of Sunda Shelf paleo-rivers contain substantially more Poaceae (grass) pollen than site offshore North Borneo. Co-occurrence of grass and rainforest pollen suggests longitudinal climate gradient with increasing aridity toward interior of glacial Sundaland. In Borneo rainforest persisted during glacial periods, but vegetation records support hypothesis of a 'savanna corridor' over LGM Sundaland (see also Morley & Morley 2022, Hamilton et al. 2023))

Clarke, W.J. & W.H. Blow (1969)- The inter-relationship of some Late Eocene, Oligocene and Miocene larger foraminifera and planktonic biostratigraphic indices. In: P. Bronnimann & H.H. Renz (eds.) Proc. First Int. Conference on Planktonic Microfossils, Geneva 1967, Brill, Leiden, 2, p. 82-97.
(Key paper from the illustrious 1960s BP paleo lab. One of first papers calibrating the Eocene- Recent larger foraminifera Letter 'Letter Stages' with the planktonic foraminifera zonation (generally difficult, as they are rarely found together due to different facies). Includes chapter on occurrences of Miogypsinidae in Indonesia (W Java, Sumatra))

Cole, W.S. (1939)- Large foraminifera from Guam. Journal of Paleontology 13, 2, p. 183-189.
(Limestones from Guam with larger foraminifera, Spiroclypeus higginsi n. sp., primitive Miogypsinoides dehaartii var. formosensis and Lepidocyclina (N.) parva, Borelis pygmaeus. Age basal Miocene, zone Lower Te (more likely latest Oligocene?; JTvG))

Cole, W.S. (1945)- Larger foraminifera of Lau, Fiji. In: H.S. Ladd & J.E. Hoffmeister (eds.) Geology of Lau, Fiji. Bernice P. Bishop Museum Bull. 181, p. 272-297.

Cole, W.S. (1950)- Larger foraminifera from the Palau Islands. U.S. Geological Survey (USGS) Professional Paper 221-B, p. 21-31.
(online at: http://pubs.usgs.gov/pp/0221b/report.pdf)
(Description of larger foramifera from Palau islands, Micronesia, SW Pacific: Late Eocene (Tab) with Pellatispira and M Miocene (Tf) with Katacycloclypeus, Lepidocyclina rutteni, Lepidocyclina palauensis n.sp. (latter re-assigned to Lepidocyclina radiata by Cole (1963))

Cole, W.S. (1954)- Larger Foraminifera and smaller diagnostic Foraminifera from Bikini drill holes. U.S. Geological Survey (USGS) Professional Paper, 260-O, p. 569-608.

Morley, R.J. (1977)- Palynology of Tertiary and Quaternary sediments in Southeast Asia. Proc. 6th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 255-276.
(Up to eight palynozones in Oligocene- Quaternary, mainly based on evolution of Florschuetzia species of mangrove pollen, building on Germeraad et al. 1968 work)

Morley, R.J. (1982)- Fossil pollen attributable to *Alangium* Lamarck (Alangiaceae) from the Tertiary of Malesia. Review Palaeobotany Palynology 36, p. 65-94.
(On four pollen-morphological evolutionary trends and Eocene-Pliocene fossil record of genus Alangium a flowering plant, in SE Asia)

Morley, R.J. (1991)- Tertiary stratigraphic palynology in Southeast Asia: current status and new directions. Bull. Geological Society Malaysia 28, p. 1-36.
(online at: https://gsm.org.my/products/702001-101072-PDF.pdf)
(Palynology is the only biostratigraphic tool for correlation of non-marine sediments and correlation across facies. Age-restricted palynomorphs are relatively few, so Tertiary palynology seems mainly useful in correlation rather than dating. Higher resolution requires quantitative palynological zonation schemes)

Morley, R.J. (1996)- Biostratigraphic characterization of systems tracts in Tertiary sedimentary basins. In: C.A. Caughey et al. (eds.) Proc. International Symposium on Sequence Stratigraphy in SE Asia, Jakarta 1995, Indonesian Petroleum Association (IPA), p. 49-70.
(On palynomorph distribution patterns in sequences/ systems tracts)

Morley, R.J. (1998)- Palynological evidence for Tertiary plant dispersals in the SE Asian region in relation to plate tectonics and climate. In: R. Hall & J.D. Holloway (eds.) Biogeography and geological evolution of SE Asia, Backhuys Publishers, Leiden, p. 211-234.
(online at; http://searg.rhul.ac.uk/publications/books/biogeography/biogeog_pdfs/Morley.pdf)
(Tertiary plant dispersals reflect tectonic and climatic evolution of SE Asia. Sunda Eocene flora stretched as far East as S arm of Sulawesi, and after Makassar Straits opening, part of this flora became stranded E of Wallace Line. Small number of plant taxa dispersed W across Wallace line since Miocene, at 17 Ma, 14, 9.5, 3.5 and ~1 Ma. Much of Sunda region moisture deficient in Oligocene- earliest Miocene, ever-wet rainforest becoming widespread at ~20 Ma, after which they repeatedly expanded and contracted. Greatest extent of rainforest at beginning of M Miocene. Quaternary 'glacial' periods with low sea levels and more seasonal climates, leading to more pine forests and savannah. New Guinea mountains formed in M Miocene allowing dispersal of Gondwana taxa from S. Some, like Podocarpus imbricatus, Phyllocladus subsequently dispersed into SE Asia)

Morley, R.J. (2000)- Tertiary history of the Malesian flora: a palynological perspective. In: L.G. Saw et al. (eds.) Taxonomy: the cornerstone of biodiversity, Forest Research Institute Malaysia, Kepong, p. 197-210.

Morley, R.J. (2000)- Origin and evolution of tropical rain forests. Hohn Wiley & Sons, Chichester, p. 1-362.
(Incl. SE Asia chapter describing Cenozoic vegetation response to plate tectonic evolution, as reflected in Indonesia palynology records. In M Eocene SW Sulawesi has Laurasian flora, and was attached to E Kalimantan. Makassar Straits became floral-faunal migration barrier in Late Eocene. First Australian- New Guinea floral elements (Casuarina, etc.) start appearing in W Java Sea around 22-21 Ma)

Morley, R.J. (2002)- Tertiary vegetation history of SE Asia, with emphasis on biogeographical relationships with Australia. In: P. Kershaw et al. (eds.) Bridging Wallace's Line: the environmental and cultural history of the SE Asian- Australian region, Advances in Geoecology 34, Catena Verlag, p. 2-28.

Morley, R.J. (2003)- Interplate dispersal paths for megathermal angiosperms. In: Perspectives in plant ecology, evolution and systematics 6, 1-2, Urban & Fischer Verlag, p. 5-20.
(Review of dispersal of megathermal angiosperms between tectonic plates in Cretaceous and Tertiary. Early Cretaceous radiation of angiosperms unrelated to formation of Tethys. Nine dispersal routes, some tied to Late Cretaceous- E Tertiary Gondwana break-up and routes formed since M Eocene phases of plate collision)

Morley, R.J. (2007)- Cretaceous and Tertiary climate change and the past distribution of megathermal rainforests. In: M.B. Bush, J.R. Flenley & W.D. Gosling (eds.) Tropical rainforest responses to climatic change, Chapter 1, Springer-Praxis, p. 1-31. *(see also 2nd Edition, 2011)*
(Review of long term climate patterns and distribution of tropical rainforests)

Morley, R.J. (2011)- Dispersal and paleoecology of tropical Podocarps. Smithsonian Contr. Botany 95, p. 21-41.
(online at: http://smithsonianrex.si.edu/index.php/scb/article/download/175/131)
(Tropical Podocarpaceae family appeared in Triassic of Gondwana and essentially remained southern family. Podocarpus s.l. dispersed into SE Asia in Late Eocene, explained by dispersal from India and possibly multiple dispersal events from Australia. Dacrydium reached SE Asia in E Oligocene and expanded range to Japan during

M Miocene climatic optimum. Dacrycarpus and Phyllocladus dispersed into New Guinea as island emerged in Late Miocene, then island hopped to Borneo in M Pliocene. Dacrycarpus reached Sumatra and Malay Peninsula in Pleistocene)

Morley, R.J. (2012)- A review of the Cenozoic palaeoclimate history of Southeast Asia. In: D.J. Gower et al. (eds.) Biotic evolution and environmental change in Southeast Asia, The Systematics Association, Cambridge University Press, Chapter 6, p. 79-114.
(online at: https://www.researchgate.net/publication/285737329_A_review_of_the_Cenozoic_palaeoclimate_history_of_Southeast_Asia)
(Summary of Cenozoic climatic and environmental history of Sunda region, from Sulawesi to S Vietnam, based on palynological records, occurrence of coals (= everwet climate) and paleosols)

Morley, R.J. (2018)- Assembly and division of the South and South-East Asian flora in relation to tectonics and climate change. J. Tropical Ecology 34, 4, p. 209-234.
(online at: www.researchgate.net/publication/326628937_Assembly_and_division_of_the_South_ Etc.)
(On main phases of plant dispersal into and out of SE Asia. Late Cretaceous poorly understood. India's drift into perhumid low latitudes during Eocene brought dispersal into SE Asia of megathermal angiosperms which originated in W Gondwana, and became established since ~49 Ma, with terrestrial connection after ~41 Ma. Oligocene was time of seasonally dry climates except along E and S seaboard of Sundaland. At end of Oligocene widespread perhumid conditions across region. Uplift of Himalaya during M Miocene thermal maximum, created dispersal of E Asian evergreen taxa into N India. After Australasia- Sunda collision and uplift of New Guinea and islands of Wallacea, Gondwanan montane taxa also found their way into region)

Morley, R.J. & J.R. Flenley (1987)- Late Cainozoic vegetational and environmental changes in the Malay Archipelago. In: T.C. Whitmore (ed.) Biogeographic evolution of the Malay Archipelago, Oxford Monographs Biogeography 4, Clarendon Press, Oxford, p. 50-59.

Morley, R.J. & Jaizan H.M. Jais (2024)- Pollen and spore atlas for the Cenozoic of the Malay Basin, Malaysia. Geological Society of Malaysia, p. 1-272.
(online at: https://gsm.org.my/articles/pollen-and-spore-atlas-for-the-cenozoic-of-the-malay-basin-malaysia/)
(Milestone atlas with descriptions of 186 Cenozoic pollen, spore and algal form-taxa that are important in evaluation of palynostratigraphy and environment interpretation in Oligocene-Pliocene of Malay Basin. With 7 new genera, 55 new form-species, 4 new forms and 10 new combinations. With summaries of PR1-PR15 bio-zonation, vegetation types, basin evolution, paleogeography and extensive references list)

Morley, R.J., E.B. Lelono, L. Nugrahaningsih & Nur Hasjim (2000)- LEMIGAS Tertiary palynology project: aims, progress and preliminary results from the Middle Eocene to Pliocene of Sumatra and Java. Geological Research Development Centre (GRDC), Paleontology Series 10, Bandung, p. 27-47.
(Summary of palynology work in Java (Eocene of Nanggulan and Bayah), Sumatra (E Oligocene Pematang Fm, Late Oligocene Talang Akar Fm, E Miocene Gumai Fm, M Miocene Air Benakat Fm. No positive records of Paleocene- Early Eocene deposits in W Indonesia)

Morley, R.J. & H.P. Morley (2013)- Mid Cenozoic freshwater wetlands of the Sunda region. J. Limnology 72, 2s, p. 18-35.
(online at: www.jlimnol.it/index.php/jlimnol/article/view/704)
(On development of widespread rift lake systems in Oligocene of SE Asia and their eventual demise following marine transgression. Pollen and spores illustrate multitude of fresh and brackish water swamp communities around margins)

Morley, R.J. & H.P. Morley (2013)- Improving stratigraphic resolution in Indonesia using the method of sequence biostratigraphy. Proc. 47th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA23-G-63, p. 1-17.
(online at: https://www.researchgate.net/publication/373546134_Improving_stratigraphic_resolution_in_Indonesia_using_the_method_of_sequence_biostratigraphy)

(About dating non-marine successions by analyzing cyclical patterns in palynological, etc., data that reflect astronomically-driven sea level changes. Palaeogene non-marine basins such as Cuu Long and Song Hong Basins in Vietnam exhibit depositional cycles reflecting 406 kyr eccentricity-driven astronomical cycles. In Mahakam Delta Miocene multiple sands within main reservoir interval driven by 106 ka eccentricity and 41 ka obliquity changes. Etc.)

Morley, R.J. & H.P. Morley (2022)- The prelude to the Holocene: tropical Asia during the Pleistocene. Holocene Climate Change and Environment 2022, p. 1-32.
(Review of climate and vegetation history for tropical Asia for last 3 Myrs. Pliocene witnessed demise of humid tropical forests across India, which were replaced at least in the north by open grasslands, which supported a diverse fauna, elements of which migrated to Java during E Pleistocene. Fauna did not migrate along a "savanna corridor"(no representatives of Indochina deciduous forests or savanna). During Pleistocene glaciation, rain forests remained along equatorial SE Asia, with savanna in Indochina and expansion of seasonal evergreen and deciduous forests across emergent Java Sea and Java)

Muller, J. (1972)- Palynological evidence for change in geomorphology, climate and vegetation in the Mio-Pliocene of Malesia. In: P.S. & M. Ashton (eds.) The Quaternary era in Malesia, University of Hull, Department of Geography Miscellaneous Series 13, p. 6-16.

Muller, J. (1978)- New observations on pollen morphology and fossil distribution of the genus *Sonneratia* (Sonneratiaceae). Review Palaeobotany Palynology 26, p. 277-300.
(Study of mangrove pollen Sonneratia, and fossil representatives Florschuetzia. May have originated in Eocene in Tethys area, but earliest reliable occurrence (Florschuetzia trilobata) from E Miocene in Sunda area)

Murgese, D.S. & P. De Deckker (2005)- The distribution of deep-sea benthic foraminifera in core tops from the eastern Indian Ocean. Marine Micropaleontology 56, p. 25-49.
(57 core tops between 700- 4335m from E Indian Ocean between Australia and Indonesia. Seven key-species useful for environments. Two species groups: (1) Oridorsalis tener umbonatus, Epistominella exigua and Pyrgo murrhina (cold, well-oxygenated, low carbon flux to sea floor) and (2) Nummoloculina irregularis and Cibicidoides pseudoungerianus (upper-bathyal). Uvigerina proboscidea mainly at low latitudes, with high carbon flux due to higher primary productivity at sea surface, and low oxygen levels due to organic matter oxidation and presence of oxygen-depleted Indonesian Intermediate Water and N Indian Intermediate Water)

Nishida, S. (1987)- Calcareous nannoplankton biostratigraphy in the Sunda Arc. Committee Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas, CCOP, Technical Bull. 19, p. 69-72.
(online at: https://ncloud.dotdream.co.th/index.php/s/xCwHAtAFYxzBtC9)
(Bottom samples from S Java continental slope and both flanks of Sunda Trench contain modern nannofossil assemblages dominated by Umbellosphaera irregularis and Gephyrocapsa oceanica)

Young, J.R. (1998)- Neogene. In: P.R. Bown (ed.) Calcareous nannofossil biostratigraphy, Chapter 8, British Micropalaeontological Society Publications Series, Chapman & Hall, p. 225-265.
(Thorough review of Miocene-Pliocene calcareous nannofossils and biozonations)

Zachariasse, W.J., W.A. Berggren, W. Si & B.T. Huber (2017)- On the taxonomic identity of the planktonic foraminiferal species *Globorotalia barisanensis* Le Roy, 1939. J. Foraminiferal Research 47, 4, p. 389-398.
(online at: https://pdfs.semanticscholar.org/fc9d/05e55c75424d1fd9590ca8ec7cbfe39d4a51.pdf)
(Holotype of Globorotalia barisanensis Le Roy 1939 from M Miocene Lower Palembang Fm in upper Kassikan section, Tapung Kiri River, C Sumatra, is non-keeled species, transitional between Gr. peripheroacuta and Gr praefohsi (zones N10-N11). Holotype should be viewed as senior synonym of Gr. peripheroacuta, but more practical to conserve latter name)

Zachariasse, W.J. & Sudijono (2012)- New data on the morphology and classification of the Oligocene-Miocene planktonic foraminifer *Paragloborotalia siakensis* (LeRoy, 1939). J. Foraminiferal Research 42, 2, p. 156-168.
(SEM images of specimens of 'Globigerina siakensis' from near its type locality in C Sumatra show spinose test and straight intercameral sutures on spiral side of test. Globorotalia mayeri has curved spiral-side intercameral sutures and lacks spinosity)

XI.4. Jurassic- Cretaceous

Numerous additional papers with Jurassic-Cretaceous biostratigraphy content but are case studies specific to certain areas, are listed under those areas, and are not repeated here.

This chapter does include several papers on Jurassic-Cretaceous faunas-floras outside Indonesia that may help in the interpretation of related occurrences in Indonesia.

Arkell, W.J. (1954)- Indo-China, Hongkong and Indonesia (Ch. 17) and New Guinea, New Caledonia, New Zealand and Australia. In: Jurassic geology of the world, Oliver and Boyd, Edinburgh, Chapter 18, p. 431-462.
(Old review of knowledge of Jurassic stratigraphies, incl. the Indonesian region (Sumatrra, Borneo, eastern Indonesia, New Guinea). Late Jurassic deposition in eastern Indonesia (Misool, Sula islands, Rotti, Timor, etc.), and New Guinea is in direct communicaton with that of the Himalayas, as suggested by macrofossil assemblages (Tethyan N Gondwana))

Baumgartner, P.O., A. Bartolini, E.S. Carter, M. Conti, G. Cortese, T. Danelian, P. De Wever et al. (1995)- Middle Jurassic to Early Cretaceous radiolarian biochronology of Tethys based on Unitary Associations. In: P.O. Baumgartner et al. (eds.) Middle Jurassic to Lower Cretaceous Radiolaria of Tethys: occurrences, systematics, biochronology, Memoires Geologie, Lausanne, p.

Baumgartner, P.O., L. O'Dogherty, S. Gorican, E. Urquhart, A. Pillevuit & P. de Wever (eds.) (1995)- Middle Jurassic to Lower Cretaceous radiolaria of Tethys: occurrences, systematics, biochronology. InterRad Jurassic-Cretaceous Working Group, Memoires Geologie (Universite de Lausanne) 23, p. 1-1172.
(Key publication on M Jurassic- E Cretaceous radiolaria from Tethys region, mainly western Tethys and Japan)

Baumgartner, P.O., L. O'Dogherty, S. Gorican, R. Dumitrica-Jud, P. Dumitrica, A. Pillevuit, E. Urquhart, A. Matsuoka et al. (1995)- Radiolarian catalogue and systematics of Middle Jurassic to early Cretaceous Tethyan genera and species. In: P.O. Baumgartner et al. (eds.) Middle Jurassic to Lower Cretaceous Radiolaria of Tethys: occurrence, systematics, biochronology. Memoires Geologie (Universite de Lausanne) 23, p. 37-685.

Beauvais L. (1989)- Jurassic corals of the Circum-Pacific area. Memoir Assoc. Australasian Palaeontologists (AAP) 8, p. 291−302.

Beauvais, L., M.C. Bernet-Rollande & A. Maurin (1985)- Reinterpretation of Pretertiary classical reefs from Indo-Pacific Jurassic examples. In: C. Gabrie & M. Harmelin (eds.) Proc. Fifth International Coral Reef Congress, Tahiti 1985, 6, Misc. Paper (B), p. 581-586.
(Jurassic carbonate mounds in W Thailand (M-U Jurassic, Mae Sot basin), C Sumatra (U Jurassic, Padang-Tembesi River) and Philippines (M Jurassic, Mindoro, U Jurassic Calamian Isl.) not 'reefs' like present day reefs. Corals typically float in lime mud matrix and are mainly digitate or lamellar, to cope with muddy conditions. Calcareous sponges also common. Main rock-building organisms are Bacinellid- Lithocodium- stromatolite assemblage, as encrusters over exotic grains or as single builder. Jurassic corals, sponges etc., have no major rock building potential)

Beauvais, L., H. Fontaine & A. Maurin (1987)- A review of recent data on mud-mounds discoveries in Asia. Oil and Gas Geology 1987, 12, p. 373-376.
(Many of Mesozoic carbonates in SE Asia are probably microbial mud mounds, not reefs: Jurassic of Sumatra, Thailand, Burma, Philippines, Sarawak-Kalimantan)

Belford D.J. & V. Scheibnerova (1971)- Turonian foraminifera from the Carnarvon Basin, Western Australia, and their palaeogeographical significance. Micropaleontology 17, p. 331-344.
(Presence of E-M Turonian planktonic foraminifera Praeglobotruncan stephani, P. hagni, P. imbricata, P. helvetica and Hedbergella spp from wells in Carnarvon Basin show Tethyan character)

Bolli, H.M. (1974)- Jurassic and Cretaceous calcisphaerulidae from DSDP Leg 27, Eastern Indian Ocean. In: J.J. Veevers et al. (eds.) Initial Reports Deep Sea Drilling Project (DSDP) 27, p. 843-907.

(online at: www.deepseadrilling.org/27/volume/dsdp27_39.pdf)
(19 new species of Pithonella, family Calcisphaerulidae, from U Jurassic and Cretaceous sediments from Sites 259, 260, 261, and 263 of Leg 27 in E Indian Ocean. Previously, calcisphaerulidae (av. size 40-120μ) described only from thin sections, like Stomiosphaeridae and Cadosinidae from Late Jurassic- earliest Cretaceous pelagic limestones of Seram, Timor, Roti, Buton and Misool by Wanner 1940 and Vogler 1941)

BouDagher-Fadel, M.K. (2008)- The Mesozoic larger benthic foraminifera: the Jurassic. In: Evolution and geological significance of larger benthic foraminifera, Chapter 4, Developments in Palaeontology and Stratigraphy, Elsevier, 21, p. 157-213.
(General review of Jurassic larger foraminifera)

Jaworski, E. (1933)- Revision der Arieten, Echioceraten und Dactylioceraten des Lias von Niederlandisch-Indien. Neues Jahrbuch Mineralogie Geologie Palaontologie, Abhandlungen, Beilage Band 70, B, p. 251-333.
(online at: http://mmtk.ginras.ru/pdf/Jaworski_1933_J_Arieten_Indonesia_HI.pdf)
('Revision of the Arietidae, Echioceratidae and Dactylioceratidae from the Liassic of Netherlands Indies'. Mainly taxonomic descriptions of Early Jurassic ammonites from Roti, Babar, Timor and Sula Islands from collections in Amsterdam, Leiden, Utrecht, Delft, Bonn, Berlin and Basel: Arnioceras spp., Arieticeras, Dactylioceras spp., Coeloceras moermanni, Euechioceras wichmanni, etc. Little on stratigraphy, no locality maps)

Jeletzky, J.A. (1963)- *Malayomaorica* gen. nov. (Family Aviculopectinidae) from the Indo-Pacific Upper Jurassic, with comments on related forms. Palaeontology 6, p. 148-160.
(online at: http://palaeontology.palass-pubs.org/pdf/Vol%206/Pages%20148-160.pdf)
(S Hemisphere Late Jurassic bivalves described as Buchia and Aucella differ from N Hemisphere-Boreal Buchia, therefore assigned to new genus Malayomaorica. Typical of Kimmeridgean of Gondwana margin, including NW Australia, New Zealand New Guinea, Misool, Sula, E Sulawesi, Timor, Ceram, Buru; JTvG)

Kobayashi, T. (1978)- The Jurassic palaeogeography of Japan and Southeast Asia. Proc. of the Japan Academy, Series B, 54, 10, p. 583-588.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/54/10/54_10_583/_pdf/-char/en)
(Review of Jurassic facies in Japan and across SE Asia, Shallow marine E Jurassic facies inSumatra and NW Kalimantan. Also Jurassic--Cretaceous marine sequence in Sarawak. With one small E Jurassic facies map (no mention of widespread marine Jurassic in East Indonesia- New Guinea; JTvG))

Kobayashi, T. (1979)- The *Trigonioides* basins and the Cretaceous palaeogeography of East and Southeast Asia. Proc. of the Japan Academy, Series B, 55, B 1, p. 1-5.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/55/1/55_1_1/_pdf)
(On distribution of Early-Middle Cretaceous non-marine bivalve mollusc Trigonioides in SE Asia, including in continental facies of Rantaulajung Fm near Martapura, SE Kalimantan with Upper Cretaceous conchostracans)

Kruizinga, P. (1931)- Cephalopoda. In: B.G. Escher et al. (eds.) De palaeontologie en stratigraphie van Nederlandsch Oost-Indie, Leidsche Geologische Mededelingen 5 (K. Martin memorial volume), p. 297-389.

(online at: www.repository.naturalis.nl/document/549628)
(Summary of state of knowledge of ammonites and belemnites in Indonesia in 1931. Highest number of species known is from Timor. Other significant cephalopd faunas on Roti, Sula Islands, Buru and Misool. Most known species of Triassic age, other rich faunas of Jurassic and Permian, but relatively few species from Cretaceous)

Leinfelder, R.R., D.U. Schmid, M. Nose & W. Werner (2002)- Jurassic reef patterns- the expression of a changing globe. In: W. Kiessling et al. (eds.) Phanerozoic Reef Patterns, Society for Sedimentary Geology (SEPM) Special Publ. 72, p. 465-520.
(online at: http://userpage.fu-berlin.de/leinfelder/palaeo_de/leinfelder/rrlprints/Leinfelder_etal_2002_lr.pdf)
(Includes brief discussions of Jurassic carbonates of W Thailand, Sumatra and Philippines. Early- Middle Jurassic reefs absent in SE Asia, except small Lithiotis bivalve mounds on Timor, due to end-Triassic extinction event, etc. Minor Late Jurassic reefs in Sumatra and Bau Limestone of Sarawak- NW Kalimantan border area)

Leupold, W. & W. Maync (1935)- Das Auftreten von *Choffatella*, *Pseudocyclammina*, *Lovcenipora* (*Cladocoropsis*) und *Clypeina* im alpinen Faziesgebiet. Eclogae Geologicae Helvetiae 28, p. 129-139.
(online at: http://retro.seals.ch/digbib/view?pid=egh-001:1935:28::191)
('The occurrences of Choffatella, Pseudocyclammina, Lovcenipora (Cladocoropsis) and Clypeina in the Alpine facies region'. First record of Late Jurassic Pseudocyclammina associated with Cladocoropsis mirabilis Felix from Switzerland. Assemblage formerly known from Japan and Barisan Mts of Sumatra (see also Maync 1952))

Livsey, A.R., D.J. Mantle, C.D. Bates & A.J. Charles (2024)- The use of quantitative palynology in Pre-Tertiary hydrocarbon exploration and development in Eastern Indonesia. Proc. 48th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA24-SS-03, p. 2006-2015.
(Review of Jurassic- E Cretaceous palynology method and zonation, as used in NW Australian shelf and in Bintuni Basin of W Papua. With biozonation charts. (thin on stratigraphic results in E Indonesia; JTvG))

Mamgain, V.D. & B.R.J. Rao (1965)- Orbitolines from the limestone intercalations of Dras Volcanics, Jammu and Kashmir State. J. Geological Society India 6, p. 122-129.
(Rich and well-preserved E Cretaceous Orbitolina (incl. Orbiqia drasensis n.sp.) in limestone intercalations in volcanic rocks of Dras, in Jammu and Kashmir state (Ladakh, N India). Also Orbitolina trochus. Barremian-Aptian age (Orbiqia now accepted as Mesorbitolina; = part of the intra-Neo?Tethyan Dras-Kohistan-Ladakh volcanic arc? = related to Woyla terrane of Sumatra?; JTvG))

Matsumaru, K., M. Aizawa, K. Mukai & A. Furusawa (2007)- Note of orbitolinid foraminifera from the Lower Aptian (Cretaceous) Shimanoshita Mudstone, Lower Yezo Group, Hokkaido, Japan. J. Saitama University Fac. Educ. 56, l, p. 367-372.
(Mid-Cretaceous 'Tethyan' larger foram genus Orbitolina at several localities across accretionary prism of SE Japan and also Taiwan Shimanoshita location E Aptian with Palorbitolina lenticularis, Mesorbitolina parva, Praeorbitolina)

Matsumaru, K., M. Ehiro & S. Kojima (2006)- On *Orbitolina* (Foraminiferida) from the Shyok suture zone, Ladakh, NW India. J. Palaeontological Society India 51, 2, p. 43-49.
(online at: http://palaeontologicalsociety.in/vol51_2/v4.pdf)
(E-M Albian Orbitolina from Lower Shyok Fm in Shyok suture zone, Ladakh, NW India, in sediments overlying ultramafic unit. Incl. Mesorbitolina texana, M. minuta, Simplorbitolina cf. conulus)

Matsumaru, K. & A. Furusawa (2007)- On orbitolinid foraminifera from the lower Aptian (Cretaceous) of Hokkaido, Japan. J. Palaeontological Society India 52, 1, p. 39-44.
(online at: http://palaeontologicalsociety.in/vol52_1/v4.pdf)
(Five E Aptian orbitolinid species in Takisato Orbitolina Lst of Hokkaido: Palorbitolina lenticularis, Mesorbitolina parva, M. minuta, M. libanica, Paleodictyoconus conica (compares to Paleo-Pacific active margin of Borneo?; JTvG))

Matsuoka, A. (1995)- Jurassic and Lower Cretaceous radiolarian zonation in Japan and in the western Pacific. The Island Arc 4, p. 140-153.
(Radiolarian zonation for Jurassic- Lower Cretaceous from Japan outcrop sections and W Pacific seafloor; applicable to low and middle paleolatitude portions of Paleo-Pacific ocean. 11 zones proposed)

Maync, W. (1952)- Critical taxonomic study and nomenclatural revision of the Lituolidae based upon the prototype of the Family, *Lituola nautiloidea* Lamarck, 1804. Contr. Cushman Foundation Foraminiferal Research 3, 2, p. 35-56.
(online at: https://cushmanfoundation.allenpress.com/portals/_default/files/pubarchive/CCFFR/03ccffr2.pdf)
(Includes discussion of Lacazina lamellifera Silvestri 1925 and Loftusia bemmeleni Silvestri 1932 from Saling Lst of S Sumatra (not species of Pseudocyclammina). Confirms presence of true Late Jurassic- E Cretaceous Loftusia and Pseudocyclammina in samples from Gumai Mts of S Sumatra (= Woyla Terrane; JTvG))

Oloriz, F. & G.E.G. Westermann (1998)- The perisphinctid ammonite *Sulaites* n. gen. from the Upper Jurassic of the Indo-Southwest Pacific. Alcheringa 22, 3-4, p. 231-240.

(New genus Sulaites comprises Oxfordian group of 'Perisphinctes' sularus and moluccanus, described from Sula Islands, and Late Oxfordian-?E Kimmeridgian 'Pseudoparaboliceras aramaraii' group described from W Papua. Genus Sulaites also known from W Papua, PNG and probably New Zealand and Nepal)

Oosting, A.M. (2004)- Palaeoenvironmental and climatic changes in Australia during the Early Cretaceous. Thesis University Utrecht, p. 1-203.
(online at: http://dspace.library.uu.nl/handle/1874/1578)
(Biochronostratigraphy for Tethyan and Boreal M Cretaceous traditionally based on ammonites, but because of lack of useful ammonites in Australian M Cretaceous, and faunal and floral latitudinal contrasts, correlations between different realms is not straightforward. Dinoflagellate cyst events combined with changes in carbon-isotope stratigraphy used here to assess Barremian- Albian stage boundaries in Australia)

Pannekoek, A.J. (1931)- Brachiopoda. In: B.G. Escher et al. (eds.) De palaeontologie en stratigraphie van Nederlandsch Oost-Indie, Leidsche Geologische Mededelingen 5, 1 (K. Martin memorial volume), chapter 12, p. 396-435.
(online at: https://repository.naturalis.nl/pub/505703)
(Summary of state of knowledge in 1931 of Late Paleozoic- Mesozoic- Tertiary brachiopod species and distribution in Indonesia)

Philippe, M., A. Boura, C. Oh & D. Pons (2014)- *Shimakuroxylon* a new homoxylous Mesozoic wood genus from Asia, with palaeogeographical and palaeoecological implications. Review Palaeobotany Palynology 204, p. 18-26.
(New type of (Late?) Jurassic-E Cretaceous fossil wood with radial pitting of 'japonicum type', named here Shimakuroxylon. Geographic distribution limited to terranes which lined S-most E Asia during Jurassic (Lhasa, Indochina, Semitau, etc.). W Kalimantan specimen in British Museum collected from Buduk (Boedak) 100km N of Pontianak, associated with bivalves identified as M Jurassic by Newton (1903) (probably Late Jurassic?). Also present in Outer Zone of SW Japan. Probably indicator for warm and wet climates)

Philippe, M., H.E. Jiang, K. Kim, C. Oh, D. Gromyko, M. Harland, I.S. Paik & F. Thevenard (2009)- Structure and diversity of the Mesozoic wood genus *Xenoxylon* in Far East Asia: implications for terrestrial palaeoclimates. Lethaia 42, p. 393-406.
(Mesozoic fossil wood Xenoxylon is indicator of wet temperate biotopes and is common in Far East Asia in Carnian-Maastrichtian. It is part of 'Northern-type' leaf-flora (also call Tetori-type or Siberian-Canadian), although still present in Vietnam. Diversity peak of Xenoxylon spp. centered on NE China, where wet-temperate climate probably prevailed through Late Triassic- Cretacous (genus not known from Indonesia or Gondwana))

Remane, J. (1985)- Calpionellids. In: H.M. Bolli, J.B. Saunders & K. Perch-Nielsen (eds.) Plankton Stratigraphy, Cambridge University Press, p. 555-572.
(Review of Late Tithonian- E Valanginian planktonic protozoans of unknown affinities. Includes reported, but not illustrated, presence of calpionellids in PNG by Rickwood (1955))

Renz, G.W. (1974)- Radiolaria from Leg 27 of the Deep Sea Drilling Project. In: J.J. Veevers et al. (eds.) Initial Reports Deep Sea Drilling Project (DSDP) 27, p. 769-841.
(online at: www.deepseadrilling.org/27/volume/dsdp27_38.pdf)
(Study of Cretaceous radiolarians from Leg 17 sites, mainly Site 261 in eastern Indian Ocean and Site 262 in Timor Trough of SW Timor. Succession of three assemblages, from young to old: (1) Bathropyramis timorensis, (2) Eucyrtis columbarius and (3) Spongocyclia lanigera Assemblage, of uncertain ages (but placed in ~Berriasian-Aptian range by Sanfilippo and Riedel 1985, Fig. 2; JTvG). Includes brief discussion of Tan Sin Hok (1927) Roti sample 149 assemblage, which is believed to be younger than this DSDP material)

Riding, J.B. (2012)- A compilation and review of the literature on Triassic, Jurassic, and earliest Cretaceous dinoflagellate cysts. American Assoc. Stratigraphic Palynologists (AASP), Contributions Series 46, Dallas, p. 1-126. *(also 2020 edition, 325 p.)*

(online at: https://nora.nerc.ac.uk/id/eprint/19423/1/Jurassic_dinocyst_reference_list_-_revised_manuscript_March_2012_word_2003.pdf)
(Parts of latest documentation of the highly successful Mesozoic dinolagellate biostratigraphy, applicable of Australia NW Shelf and New Guinea margins)

Riding, J.B. (2013)- The literature on Triassic, Jurassic and earliest Cretaceous dinoflagellate cysts: supplement 1. Palynology 37, 2, p. 345-354.

Riding, J.B., E. Mariani & R.A. Fensome (2022)- A review of the Jurassic dinoflagellate cyst genus *Gonyaulacysta* Deflandre 1964 emend. nov. Review Palaeobotany Palynology 299, 104605, p. 1-37.
(Review of M-L Jurassic gonyaulacacean dinoflagellate cyst genus Gonyaulacysta Deflandre, including material from Australia NW Shelf)

Sahni, M.R. & V.V. Sastri (1957)- A monograph of the orbitolines found in the Indian continent (Chitral, Gilgit, Kashmir), Tibet and Burma, with observations on the age of the associated volcanic series. Memoirs Geological Survey India, Palaeontologia Indica 33, 3, p. 1-50.
(online at: http://histdept.crma.ac.th:8011/ebooks/20100511-the-geological-survey-of-india.pdf)
(Mid-Cretaceous larger foraminifera Orbitolina from localities in collision zones around N and NE margin of Indian subcontinent. Including multiple Myanmar localities (Yanbo, Ku Taung, Mesan, etc.), initially sampled by Clegg. Two Orbitolina limestone horizons in Burma: (1) Barremian- Aptian with Orbitolina bulgarica, O wadiai n.sp., O. raoi n.sp. and O. hukawngensis n.sp.; (2) Cenomanian with Orbitolina birmanica Sahni 1937 (species with great affinity with Orbitolina concava)

Sano, S.I. & P.W. Skelton (2010)- *Epidiceras* (Bivalvia, Hippuritoidea) from the Tithonian-Berriasian Torinosu-type Limestones of the Sakawa Area, Southwest Japan. Turkish J. Earth Sciences 19, p. 733-743.
(online at: http://journals.tubitak.gov.tr/earth/issues/yer-10-19-6/yer-19-6-5-0905-2.pdf)
(Primitive rudists Epidiceras speciosum and E. guirandi from Tithonian-Berriasian Torinosu limestones in SW Japan. Epidiceras speciosum also present in Kimmeridgean-Tithonian Bau Limestone of SW Sarawak. Tethyan rudists proven here to extend into W Pacific province)

Sarjeant, W.A.S., W. Volkheimer & W.P. Zhang (1992)- Jurassic palynomorphs of the Circum-Pacific region. In: G.E.G. Westermann (ed.) The Jurassic of the Circum-Pacific, World and Regional Geology 3, p. 273-292.
(Includes discussion of Jurassic palynomorphs/ dinoflagellates of Papua New Guinea, Australia. The only Jurassic palynoflora from SE Asia is partly published work from Misool by Helby and Hasibuan: Yefbie Shale has characteristic Toarcian Susadinium assemblage and Bajocian- E Bathonian Dissioliodinium association;base Demu Fm has Late Callovian- E Oxfordian Rigaudella aemula zone, Late Oxfordian- E Kimmeridgean Wanaea spectabilis zone in rest of Demu Fm and basal Lelinta shale; later assemblages suggest age as young as Kalyptea wisemaniae zone, E Berriasian)

Sato, T. (1956)- Correlation du Jurassique inferieur japonais en basant sur les ammonites fossiles. J. Geological Society Japan 62, 732, p. 490-503. *(Japanese with French abstract)*
(online at: www.jstage.jst.go.jp/article/geosoc1893/62/732/62_732_490/_pdf)
(Incl. circum-Pacific 'Aalenian' (Late Toarcian?) ammonite distribution map, showing distribution of Hammatoceras in E Indonesia)

Sato, T. (1975)- Marine Jurassic formations and faunas in Southeast Asia and New Guinea. In: T. Kobayashi & R. Toriyama (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 15, p. 151-189.
(Review of Jurassic macrofossils and stratigraphy in SE Asia, including Sumatra, Timor,New Guinea, E Sulawesi, Sula, Buru, Ceram and Misool)

Sato, T. & T. Ishibashi (1984)- Ammonoids of Southeast Asia. In: T. Kobayashi, R. Toriyama & W. Hashimoto (eds.) Geology and palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 267-272.
(Brief review of Triassc- Cretaceous ammonoids in Indonesia and surrounding SE Asia. No figures)

Sato, T. & G.E.G. Westermann (1991)- 4. Japan and Southeast Asia. In: G.E.G. Westermann & A.C. Ricardi (eds.) Jurassic taxa ranges and correlation charts fror the Circum-Pacific. Newsletters on Stratigraphy 24, 1-2, p. 81-108.
(Useful compilation of distribution and ranges of Jurassic macrofossils in Indonesia)

Scrivenor, J.B. (1912)- Radiolaria-bearing rocks in the East Indies. Geological Magazine (V), 9, 6, p. 241-248.
(Review of mainly Mesozoic radiolarian-bearing rocks on the Malay Peninsula and Indonesia. Radiolarites of Danau Fm of C Borneo (probable Jurassic age) do look like oceanic deposits, but other radiolaria-bearing rocks often associated with clastic material and may be of shallower marine origin)

Sha, J. (2007)- Cretaceous trigonioidid (non-marine Bivalvia) assemblages and biostratigraphy in Asia with special remarks on the classification of Trigonioidacea. J. Asian Earth Sciences 29, 1, p. 62-83.
(Seven zones distinguished in distribution of Cretaceous Trigonioides-group fresh water molluscs. Mainly on mainland Asia (China, Korea, some Thailand) and Japan; nothing on Indonesia although Cretaceous non-marine bivalves are present in SE Kalimantan)

Sha, J. (2010)- Historical distribution patterns of trigonioidids (non-marine Cretaceous bivalves) in Asia and their palaeogeographic significance. Proc. Royal Society (London), B (Biological Science), 277, p. 277-283.
(online at: http://rspb.royalsocietypublishing.org/content/early/2009/07/15/rspb.2009.0936.full.pdf)
(Non-marine trigonioidid bivalves five phases of radiation in Cretaceous of Pal-Asia: pre-Aptian (?Valanginian/ Hauterivian- Barremian), Aptian, Albian, Cenomanian and Turonian-Maastrichtian. Distribution patterns show two distinct paleo-river systems feeding trigonioidids. Trigonioidid distribution pattern suggests Japan was attached to part of E China and/or Korea in Valanginian-Cenomanian (no discussion of records from Indonesia))

Sha, J., A. Meesook & X.K. Nguyen (2012)- Non-marine Cretaceous bivalve biostratigraphy of Thailand, Southern Lao PDR and Central Vietnam. J. of Stratigraphy 36, 2, p. 382-399.
(online at: https://dcxz.cbpt.cnki.net/portal/journal/portal/client/paper/448cc2031c16a43c1e8e5005490a83d6)
(Bivalve molluscs from non-marine Cretaceous basin of Thailand, Laos and Vietnam (Khorat Group). Two trigoniodid bivalve assemblages: Aptian Trigonioides kobayashii- Plicatounio assemblages and mainly Albian Trigonioides diversicostatus- Pseudohyria assemblage)

Skelton, P.W. (1985)- Preadaptation and evolutionary innovation in rudist bivalves. Special Papers in Palaeontology 33, p. 159-173.
(Includes mention of early rudists Epidiceras speciosum (Goldfuss) and Valletia sp. from Bau Limestone in SW Sarawak, in collections of British Museum of Natural History, London)

Skelton, P.W., S.I. Sano & J.P. Masse (2013)- Rudist bivalves and the Pacific in the Late Jurassic and Early Cretaceous. J. Geological Society, London, 170, p. 513-526.
(Rudist distribution in Pacific region. (very little on SE Asia region rudists (Borneo, Misool))

Skwarko, S.K. & F. Hasibuan (1989)- A brief review of literature on the larger marine invertebrates in the Cretaceous of Indonesia with list of fossils hitherto identified. Geological Research Development Centre (GRDC), Bandung, Seri Paleontologi 6, p. 44-52.
(Listing of 32 papers with descriptions of Cretaceous marine macrofossils from Indonesia since 1883. 22 faunas documented, 8 from Kalimantan, 3 each from Sumatra, Sula Islands, Misool and W Papua, one from Sulawesi. Bivalve molluscs (80 species) and cephalopods (70 species) are most diverse groups. Most determinations in need of revision)

Stevens, G.R. (1963)- Designation of a lectotype for the nominal species *Belemnopsis alfurica* (Boehm) 1907 (Cephalopoda, Dibranchiata). Trans. Royal Society of New Zealand, Geology, 2/6, p. 101-104.
(Designation of a lectotype for U Jurassic Belemnopsis alfurica (Boehm) from Upper Wai Lagoi River, Taliabu, Sula Islands. Also known as Belemnites alfurica from N India Himalayas, N Australia and New Zealand)

Stevens, G.R. (1964)- The belemnite genera *Dicoelites* Boehm and *Prodicoelites* Stolley. Paleontology 7, 4, 9, 606-620.
(online at: http://palaeontology.palass-pubs.org/pdf/Vol%207/Pages%20606-620.pdf)
(Belemnite genus name Dicoelites first used by Boehm (1906) for D. dicoelus Rothpletz from Callovian-Lower Oxfordian of Roti Island, then in 1912 for material from Callovian-Kimmeridgean? of Wai Miha, Taliabu, Sula islands (Dicoelites keeuwensis). Both have two grooves, but latter re-assigned to new genus Conodicoelites)

Stevens, G.R. (1965)- The Jurassic and Cretaceous belemnites of New Zealand and a review of the Jurassic and Cretaceous belemnites of the Indo-Pacific region. New Zealand Geological Survey, Paleontological. Bulletin 36, p. 1-283.
(Major review of J-K belemnites. In Oxfordian development of Indo-Pacific province. Kimmeridgean abundant Belemnopsis developed in Indo-Pacific, incl. Belemnopsis uhligi complex (Belemnopsis spp., incl. uhligi, indica, moluccana, etc.; formerly comonly called B. gerardi). Usually associated with Buchia and Inoceramus. In Tithonian uhligi complex persists, but progressively replaced by Hibolithes and Duvalia assemblage. Etc.)

Stolley, E. (1929)- Uber Ostindische Jura-Belemniten. Palaontologie von Timor, Schweizerbart, Stuttgart, 16, 29, p. 91-213.
('On East Indies Jurassic belemnites'. Belemnites from Molengraaff, Jonker and Weber collections from Timor, Roti, Misool, Sula islands, Seram, E Sulawesi and Yamdena/Tanimbar. Includes reports of Belemnopsis aucklandica from Timor (Ofu) and Roti (re-assigned to Belemnopsis uhligi-jonkeri group by Stevens 1964. B. aucklandica from Yamdena, re-described as Belemnopsis stolleyi by Stevens 1964; JTvG)

Street, C. & P.R. Bown (2000)- Palaeobiogeography of Early Cretaceous (Berriasian-Barremian) calcareous nannoplankton. Marine Micropaleontology 39, p. 265-291.
(Early Cretaceous nannoplankton biogeography Watznaueria spp. dominant in all settings. Assemblage composition relatively uniform between ~50° N and S. High-paleolatitude assemblages less rich, lower diversity and with more Crucibiscutum salebrosum, Stradnerlithus silveradius, Broinsonia matalosa, etc. Argo Abyssal Plain, NW of Australia, carries southern high-latitude nannofossil assemblages)

Thierry, J. (1976)- Paleobiogeographie de quelques Stephanocerataceae (Ammonitina) du Jurassique moyen et superieur; une confrontation avec la theorie mobiliste. Geobios 9, 3, p. 291-331.
(Paleogeography of Middle-Late Jurassic ammonites, showing distribution of 'Tethyan' Macrocephalites-Mayaites group (also known from E Indonesia and New Guinea; JTvG)

Van Gorsel, J.T. (1978)- Late Cretaceous orbitoidal foraminifera. In: R.H. Hedley and C.G. Adams (eds.) Foraminifera 3, Academic Press, London, p. 1-120.
(General review of Campanian-Maastrichtian orbitoidal larger foraminifera. In SE Asia members of 'Caribbean-Tropical Pacific' assemblage with Pseudorbitoides, Orbitoides, Asterorbis, etc. present in PNG, W Papua and E Philippines. Occurrence of Maastrichtian Omphalocyclus in Kalimantan never described elsewhere)

Van Gorsel, J.T. (2014)- An introduction to Mesozoic faunas and floras of Indonesia. Berita Sedimentologi 31, p. 27-56.
(online at: https://journal.iagi.or.id/index.php/FOSI/article/view/123/93)
(Review of Mesozoic fossils of Indonesia. Mesozoic-age faunas relatively widespread in Indonesia, from Sumatra, Java and Kalimantan in W to Sulawesi, Outer Banda Arc (Sumba, Timor, Tanimbar, Seram), Sula Islands and New Guinea in East. Triassic low-latitude Tethyan faunas present in both W and E Indonesia. Late Jurassic ammonites and bivalves from E Indonesia- New Guinea of more temperature character)

Vitacca, J.J., N. Sinclair, D.J. Mantle, N. Marshall & D. Peyrot (2022)- The taxonomy of selected marine microplankton from the Middle and Upper Jurassic (Callovian-Kimmeridgian) of the North West Shelf, Australia. Review Palaeobotany Palynology 304, 104668, p. 1-31.
(11 new species of M-U Jurassic dinoflagellates from Australia NW Shelf)

Von Hillebrandt, A., P. Smith, G.E.G. Westermann & J.H. Callomon (1992)- Ammonite zones of the Circum-Pacific region. In: G.E.G. Westermann (ed.) The Jurassic of the Circum-Pacific, Cambridge University Press, p. 247-272.
(Jurassic ammonite zonations of Circum-Pacific region. Lower Jurassic (Toarcian) ammonites known from Kalimantan, Sula Islands, Misool and Timor and Roti. M Jurassic ammonites mainly on Sula Islands and New Guinea (Bajocian-Bathonian Sulaites, Lower Callovian Macrocephalites keeuwensis assemblage. U Jurassic (Oxfordian Mayaites) also rich on Sula Islands; Kimmeridgean ammonites virtually unknown)

Von Hillebrandt, A., G.E.G. Westermann, J.H. Callomon & R.L. Detterman (1992)- Ammonites of the Circum-Pacific region. In: G.E.G. Westermann (ed.) The Jurassic of the Circum-Pacific, Cambridge University Press, New York, p. 342-359.
(Review of Jurassic ammonite stratigraphic and geographic distributions in Pacific region. Sula- New Guinea sub-province of Indo-Pacific Province in Bajocian- Bathonian, characterized by endemic Irianites, Satoceras and Praetulites. In Oxfordian more extended Indo-SE Pacific realm, with mayaitids also in New Zealand)

Wan, X., Y. Wu & G. Li (2003)- Distribution of Mid-Cretaceous Orbitolinids in Xizang (Tibet) and its paleobiogeographic implications. Acta Geologica Sinica 77, 1, p. 1-8. *(Chinese with English Abstract)*
(online at: www.jourlib.org/paper/4876549#.V9XKwvkrKUk)
(Mid-Cretaceous Orbitolinid larger foraminifera common in Barremian- Cenomanian of shallow marine Neotethys margins. In Tibet limited to Lhasa Block (= SE Eurasia margin during M Cretaceous) and parts of Qiantang, extending E to Myanmar and W to Ladakh. Not present on India Plate (also known from Sumatra, Java, Borneo; JTvG))

Wandel, G. (1936)- Beitrage zur Kenntnis der Jurassischen Molluskenfauna von Misol, Ost Celebes, Buton, Seran und Jamdena. In: J. Wanner (ed.) Beitrage zur Palaeontologie des Ostindischen Archipels 13, Neues Jahrbuch Mineralogie Geologie Palaeontologie, Beilage Band 75B, p. 447-526.
('Contributions to the knowledge of Jurassic molluscs from Misool, East Sulawesi, Buton, Seram and Yamdena'. Description of Mollusca, mainly collected by F. Weber. Misool faunas include upper Liassic Harpoceraten beds, lower Dogger Hammoceraten beds, Oxfordian Aucella malayomaorica marls (also in E Sulawesi). 'Lithacocera' from E Sulawesi is a Tithonian form (Arkell, 1954). Etc.)

Yabe, H. & S. Hanzawa (1926)- *Choffatella* Schlumberger and *Pseudocyclammina*- a new genus of arenaceous foraminifera. Science Reports Tohoku Imperial University, 2nd series, Geology, 9, p. 9-13.
(online at: http://ir.library.tohoku.ac.jp/re/bitstream/10097/30196/1/KJ00004178170.pdf)
(New genus name Pseudocyclammina for Late Jurassic foram 'Cyclammina' lituus from Torinosu Limestone of Japan, which species is very similar to Choffatella cyclamminoides n. sp. described by Silvestri (1925) from Sungi Tuni in Korinci, Jambi Province, Sumatra)

Yabe, H. & S. Toyama (1927)- *Cladocoropsis mirabilis* Felix from the Torinosu Limestone of Japan. Japanese J. Geology and Geography 5, p. 107-110.
(online at: https://babel.hathitrust.org/cgi/pt?id=nyp.33433110166588&seq=351)
(On (Late) Jurassic Cladocoropsis, a reefal sponge or branching stromatoporoid, in Pacific accreted terranes belt of SW Japan (frequently erroneously assigned to (Triassic) genus Lovcenipora). Widespread in Tethyan reefal limestone facies (Leinfelder et al. 2005) (also known from Sumatra (Gumai Mts= Woyla Terrane), Borneo, Timor, possibly same as Lovcenipora vinassai from Triassic of Buru- Seram?; JTvG))

Yin, J. & R. Enay (2004)- Tithonian ammonoid biostratigraphy in eastern Himalayan Tibet. Geobios 37, 5, p. 667-686.
(Rich ammonoid faunas in Tithonian- Lw Berriasian in E Himalayas of Tibet, with Tithonian Virgatosphinctes-Aulacosphinctoides and Uhligites-Aulacosphinctes; U Tithonian dominated by Blanfordiceras wallichi, etc. Also presence of Kimmeridgean Sulaites and Belemnopsis galoi. (NB: strong affinities between M-L Jurassic ammonite faunas of N India- Tibetan Himalayas area and E Indonesia (Sula islands, New Guinea)- SW Pacific ammonoid faunas, typical of the Jurassic North Gondwana margin- southern Meso- or Neo-Tethys; JTvG)

XI.5. Triassic

N

umerous additional papers recording Jurassic-Cretaceous biostratigraphy content, but are case studies of specific areas, are listed under those areas;and are not repeated here.

This chapter does also Include many Jurassic-Cretaceous faunas-floras outside Indonesia that may help unravel genetically related related geologic settings)

1. As mentioned for the other sub-chapters on Biostratigraphy, many papers documenting occurrences of Triassic fossils from Indonesia as well as surrounding areas are grouped with their respective areas, and are not duplicated here;
2. This listing below captures more general papers on Triassic fossils, including papers from outside Indonesia, that may be relevant for determining paleobiogeographic affinities of Triassic faunas and floras of Indonesia
3. Of particular interest are Late Triassic limestones, with Tethyan faunas are particularly widespread, from mainland SE Asia (Thailand, Laos, Vietnam, Indonesia (Sumatra, Timor, Seram), NW Australia (Wombat Plateau) to 'Panthalassan' seamount carbonates in accretionary complexes in Japan

Ager, D.V. (1968)- The supposedly ubiquitous Tethyan brachiopod *Halorella*. J. Paleontological Society of India 5-9, p. 54-70.
(online at: http://palaeontologicalsociety.in/vol5/v11.pdf)
(Late Triassic rhynchonellid brachiopod Halorella common in Europe. Halorella nimassica described from Timor by Krumbeck (1921-1924) not true Halorella, but assigned to Timorhynchia n. gen., Halorella spp. described from Seram by Wanner (1907) look more like true Halorella, but here placed in Halorelloidea)

Al-Shaibani, S., D. Altiner, P. Bronnimann, D.J. Carter & L. Zaninetti (1982)- *Triasina hantkeni* Majzon, 1954 (Foraminifere), dans le Trias superieur de la Tethys (Europe et Asie). Archives Sciences Geneve 35, 2, p. 137-142.
('Triasina hantkeni Majzon 1954 (foraminifer), in the Upper Triassic of the Tethys (Europe and Asia)'. Norian-Rhaetian small benthic foram Triasina, known in Tethys from Europe to E Indonesia (Seram))

Ando, H. (1987)- Paleobiological study of the Late Triassic bivalve *Monotis* from Japan. The University of Tokyo Museum Bull. 30, p. 1-110.
(online at: http://umdb.um.u-tokyo.ac.jp/DKankoub/Bulletin/no30/no30000.html)
(Monograph of Late Triassic 'flat clam' Monotis in Japan, with discusssion of global distribution)

Carter, E.S. (2007)- Global distribution of Rhaetian radiolarian faunas and their contribution to the definition of the Triassic-Jurassic boundary. In: S.G. Lucas & J.A. Spielmann (eds.) The global Triassic, New Mexico Museum of Natural History and Science Bulletin 41, p. 27-31.
(online at: http://paleo.cortland.edu/globaltriassic/Bull41/09-Carter%20(radiolarians).pdf)
(Includes comparison with Rhaetian radiolarian faunas from Meto River, West Timor as described by Rose (1994). Assemblages not typically Tethyan, but mix of cosmopolitan taxa and species with stronger affinities to Japan and Philippines)

Chablais, J. (2010)- Sedimentology and biostratigraphy of the Upper Triassic atoll-type carbonates of the Sambosan Accretionary Complex (Panthalassan domain; Japan). Doct. Thesis Universite de Geneve, Sc.4212, p. 1-204.
(online at: https://archive-ouverte.unige.ch/unige:8438)
(Part of series of papers on U Triassic (Norian-Rhaetian) carbonates from limestone-capped seamount in Sambosan Accretionary Complex. With typical 'Tethyan' Late Triassic benthic foram assemblages, incl. Aulotortus friedli, etc. (related assemblages also in Timor; JTvG))

Chablais, J., R. Martini, F. Kobayashi, G.M. Stampfli & T. Onoue (2011)- Upper Triassic foraminifers from Panthalassan carbonate buildups of Southwestern Japan and their paleobiogeographic implications. Micropaleontology 57, 2, p. 93-124.

(online at: https://www.researchgate.net/publication/230776641_Upper_Triassic_foraminifers_from_Panthalassan_carbonate_buildups_of_Southwestern_Japan_and_their_paleobiogeographic_implications)
(60 species of foraminifera in U Triassic 'Panthalassan' seamount atoll-type carbonates in Late Jurassic- E Cretaceous Sambosan Accretionary Complex of SW Japan. Four associations: (1) lagoonal with common Aulotortidae, Nodosariidae and Endotebidae; (2) Back- and fore-reef: mainly Duostomina and Variostoma; (3) reefal: Galeanella, Hoyenella, Ophthalmidium and Cucurbita; (4) Shoal facies rich in ooids and near-monospecific Pilammina sulawesiana association (as also known from E Sulawesi). Carnian-Norian age similar to Tethyan carbonate platform/ reefs in European Alps, Asinepe Limestone in Seram, etc.. Foraminifera of Tethyan tropical affinity, suggesting paleoposition at low-middle latitude in S Hemisphere, in agreement with presence of endemic foraminifers and corals of Timor and Sulawesi. Sambosan AC seamounts moved >15000 km to be accreted against Asian blocks, which fits with velocity/direction of plates during Neotethys ridge opening)

Chablais, J., R. Martini, E. Samankassou, T. Onoue & H. Sano (2010)- Microfacies and depositional setting of the Upper Triassic mid-oceanic atoll-type carbonates of the Sambosan Accretionary Complex (southern Kyushu, Japan). Facies 56, p. 249-278.
(Of interest for comparison with Triassic 'Fatu Limestones' of Timor;also Seram?; JTvG)

(online at: http://library.dmr.go.th/Document/DMR_Technical_Reports/1984/24271.pdf)
(Selection of age-significant Triassic microfossils from Thailand and adjacent regions. Ammonites and thin-shelled molluscs (Daonella, Halobia, Monotis) most important. With 5 plates and range chart)

Cirilli, S. (2010)- Upper Triassic- lowermost Jurassic palynology and palynostratigraphy: a review. In: S.G. Lucas (ed.) The Triassic timescale, Geological Society, London, Special Publ. 334, p. 285-314.
(Late Triassic- E Jurassic palynostratigraphy and latitudinal control on distribution of 'Onslow' (rel. warm, southern Tethys margin) vs. 'Ipswich' (cool, high-latitude Gondwanan) microfloral provinces in S Hemisphere)

De Franceschi, D. & C. Vozenin-Serra (1997)- The Upper Vietnamese Triassic flora: palaeogeographical significance. Comptes Rendus Academie Sciences, Paris, ser. 2, 324, 4, p. 333-340.
(Vietnamese Triassic flora belongs to coastal floristic assemblage of SW Pacific. Affinities of plant-fossil assemblage with 'Krusin flora' of NW Borneo)

Diener, C. (1918)- Nachtrage zur Dibranchiatenfauna der Halstatter Kalke. Jahrbuch Geologischen Reichsanstalt, Wien, 1918, 68, 3, p. 475-492
(online at: https://opac.geologie.ac.at/ais312/dokumente/JB0683_475_A.pdf)
('Additions to the Dibranchiate fauna of the Halstatter Limestone'. Mainly comparison of Late Triassic belemnoid faunas from Timor and North Calcareous Alps in Austria. In both areas very similar thin-ribbed Aulacoceras sulcatum group. Prefers to maintain Aulacoceras timorense Wanner as separate species)

Dobruskina, I.A. (1994)- Triassic floras of Eurasia. Osterrreichische Akademie der Wissenschaften, Erdwissenschaftlichen Kommissionen, Band 10, Springer Verlag, Vienna, p. 1-422.
(online at: http://jurassic.ru/pdf/Dobruskina1994.pdf)
(Extensive review of Triassic plant fossils from Europe and Asia. Brief discussions on Far East Asia, incl. Triassic floras from Thailand (Norian- Rhaetian, near base of Khorat Group), Vietnam (Norian-Rhaetian 'Tonkin flora') and Sarawak (Carnian 'Krusin flora', near basal conglomerates of Halobia clastics series))

Dolby, J.H. & B.E. Balme (1976)- Triassic palynology of the Carnarvon Basin, Western Australia. Review Palaeobotany Palynology 22, p. 105-168.
(Five Triassic palynological assemblage zones in wells from Carnarvon Basin: I. Kraeuselisporites saeptatus (Griesbachian-Smithian, II. Tigrisporites playfordii (Smithian-Anisian), III. Staurosaccites quadrifidus (Anisian-Carnian), IV. Samaropollenites speciosus (Carnian) and V. Minutosaccus crenulatus (Carnian-?Norian). Provincialism in M-L Triassic floras:(1) Onslow microflora on NW Shelf, with mixed Gondwanan- European

elements; (2) Ipswich microflora: less diverse Falcisporites-dominated assemblages in E and S Australia; European elements not present)

Foster, C.B., B.E. Balme & R. Helby (1994)- First record of Tethyan palynomorphs from the Late Triassic of East Antarctica. BMR. J. Australian Geology Geophysics 15, p. 239-246.
(online at: www.ga.gov.au/corporate_data/49409/Jou1994_v15_n2.pdf)
(Remarkable 'Onslow-type' ('Tethyan') Norian microflora from Prince Charles Mts, E Antarctica, with Minutosaccus crenulatus, Ovalipollis ovalis, Samaropollenites speciosus, Falcisporites australis, etc. (also known from Australian NW Shelf, Timor, etc; JTvG.))

Gardin, S., L. Krystyn, S. Richoz, A. Bartolini & B. Galbrun (2012)- Where and when the earliest coccolithophores? Lethaia, 10.1111, p. 1-17.
(First coccoliths appear in Late Triassic, with oldest species Crucirhabdus minutus and Prinsiosphaera triassica appearing in latest Norian. Across Norian-Rhaetian boundary increase in abundance of Prinsiosphaera triassica and appearance of Euconusphaera zlambachensis (two most important Rhaetian pelagic carbonate producers). Both present on Timor and the Wombat Plateau (off NW Australia) (also on Seram?; JTvG))

Goudemand, N., M.J. Orchard, H. Bucher & J. Jenks (2012)- The elusive origin of *Chiosella timorensis* (conodonts, Triassic). Geobios 45, 2, p. 199-207.
(online at: https://www.zora.uzh.ch/id/eprint/57300/1/1-s2.0-S0016699511000969-main.pdf)
(First occurrence of conodont Chiosella timorensis is good marker for Anisian age (species originally described as Gondolella timorensis from Lacan, Manatuto district, Timor, by Nogami (1968))

Grant-Mackie, G.A. (1975)- The stratigraphy and taxonomy of the Upper Triassic bivalve *Monotis* in New Zealand. Ph.D. Thesis University of Auckland, p. 1-380.
(online at: https://researchspace.auckland.ac.nz/handle/2292/2580)
(20 taxa recognized in New Zealand Late Triassic bivalve genus Monotis (of interest for comparisons with M-L Triassic Monotis species from Borneo, Buton, Seram, etc.; JTvG))

Grant-Mackie, G.A. (1978)- Subgenera of the Upper Triassic bivalve *Monotis*. New Zealand J. Geology Geophysics 21, 1, p. 97-111.
(online at: www.tandfonline.com/doi/abs/10.1080/00288306.1978.10420726)
(Proposal of five subgenera of Monotis. Monotis s.s. resembles salinaria group, M. (Entomonotis) includes M. ochotica, subcircularis, and zabaikalica groups; M. (Eomonotis) typha group and M. (Maorimonotis))

Hasibuan, F. (2010)- The Triassic marine biota of Eastern Indonesia and its interregional and global correlation: a review. Jurnal Geologi Indonesia (IJOG) 5, 1, p. 31-47.
(online at: https://ijog.geologi.esdm.go.id/index.php/IJOG/article/view/91/91)
(Marine macrofossil biostratigraphy of Triassic in Indonesia. Mainly on ammonoids from Triassic of Timor (E-M and Late Triassic) and Misool (M-L Triassic), and correlations with regions outside Indonesia)

Hasibuan, F. & Purnamaningsih (1998)- Pre-Tertiary biostratigraphy of Indonesia. In: J.L. Rau (ed.) Proc. 34th Session Coord. Comm. Coastal Offshore Geoscience Programmes E and SE Asia (CCOP), Taejon, Korea 1997, 2, Technical Reports, p. 40-54.
(Review of Paleozoic- Mesozoic marine macrofossil biostratigraphy of Indonesia, particularly in Misool island)

Hautmann, M. (2001)- Die Muschelfauna der Nayband-Formation (Obertrias, Nor- Rhat) des ostlichen Zentraliran. Beringeria 29, p. 1-181.
(online at: http://opus.bibliothek.uni-wuerzburg.de/frontdoor/index/index/docId/1817)
('The bivalve fauna of the Nayband-Formation (U Triassic, Norian-Rhaetian) of east-central Iran'. Well-preserved bivalve fauna with >100 species. Paleogeographic analysis of Tethyan bivalve faunas suggests E Tethys province, with northern (Iran, Yunnan, Vietnam, Burma, W Sumatra) and southern subprovinces (Lhasa-block, E Indonesia terranes; attached to Gondwana until end Triassic and separated later by opening of 'Ceno-Tethys' Ocean (= Mesotethys?; JTvG))

Hautmann, M., M.J. Benton & A. Tomasovych (2008)- Catastrophic ocean acidification at the Triassic-Jurassic boundary. Neues Jahrbuch Geologie Palaontologie, Abhandlungen 249, p. 119-127.
(On end-Triassic extinction of reefal organisms and end of carbonate deposition at Triassic- Jurassic boundary in many parts of world, caused by ocean acidification, tied to volcanic degassing (this may be a potential explanation why Late Triassic carbonate platform limestones are rel. widespread in E Indonesia, but Early Jurassic carbonates are rare to absent; JTvG))

Hautmann, M. (2012)- Extinction: end-Triassic mass extinction. In: eLS online, John Wiley & Sons, p. 1-10.
(On mass extinction at end of Triassic, at ~200 Ma. This event eliminated conodonts and nearly annihilated corals, sphinctozoan sponges and ammonoids. Probably caused by volcanic activity of Central Atlantic Magmatic Province. Lead to virtual absence of reef systems for nearly 10 Myrs in E Jurassic).

Helby, R., V.D. Wiggins & G.J. Wilson (1987)- The circum-Pacific occurrence of the Late Triassic dinoflagellate *Sverdrupiella*. Australian J. Earth Sciences 34, p. 151-152.
(Late Triassic dinoflagellate genus Sverdrupiella Bujak and Fisher widespread, abundant and relatively diverse in Norian strata. Reported from Seram, E Indonesia, in Norian Kanikeh Fm, associated with undescribed dinoflagellate suite including suessioids and Heibergella (=Hebecysta balmei zone?; JTvG). Circum-Pacific distribution of Sverdrupiella in Late Triassic similar to distribution of Late Triassic bivalve Monotis)

Hinde, G.J. (1908)- Radiolaria from Triassic and other rocks of the Dutch East Indian Archipelago. In: R.D.M. Verbeek, Molukkenverslag. Geologische verkenningstochten in het oostelijke gedeelte van den Nederlandsch Oostindische Archipel. Jaarboek Mijnwezen Nederlandsch Oost-Indie 37 (1908), Wetenschappelijk Gedeelte, p. 694-736.
(Radiolaria from Timor, Savu, Ceram, Sulawesi, Buru and Mangoli collected by Verbeek, probably mainly of Late Triassic-Jurassic age. 83 species identified, 74 new. Richest assemblages found in Halobia-Daonella-bearing cherty limestones from Rote and Savu and Halobia limestone from Timor. Fewer, but similar species in loose chert pebbles collected at Seram and E Sulawesi)

Ichikawa, K. (1958)- Zur Taxonomie und Phylogenie der triadischen „Pteriidae" (Lamellibranchiata) mit besonder Berucksichtigung der Gattungen *Claraia, Eumorphotis, Oxytoma* und *Monotis*. Palaeontographica, A111, 5-6, p. 131-212.
('On the taxonomy and phylogeny of the Triassic 'Pteriidae' (Lamellibranchiata), with particular emphasis on the genera Claraia, Eumorphotis, Oxytoma und Monotis'. Includes description of new species Monotis (Entomonotis) timorica from Timor (which is same as Monotis subcircularis Gabb; Westermann 1962))

Ishibashi, T. (1975)- Some Triassic ammonites from Indonesia and Malaysia. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 16, p. 45-56

Jasin, Basir (2018)- Radiolarian biostratigraphy of Malaysia. Bull. Geological Society Malaysia 65, p. 45-58.
(online at: https://gsmpubl.files.wordpress.com/2018/08/bgsm201805.pdf)
(Two types of radiolarian cherts in Malaysia:bedded chert and chert blocks. Bedded cherts in Peninsular Malaysia mainly in Western Belt (Kubang Pasu, Kenny Hill and Semanggol Fms). In Sabah in Sabah Ophiolite Complex. In Sarawak bedded cherts in Serian Volcanic Fm and basal part of Pedawan Fm. Chert blocks mainly in Bentong Raub Suture Zone of Peninsular Malaysia and melanges of Sabah and Sarawak. Radiolarians from Peninsular Malaysia Late Devonian-Triassic, with 16 biozones identified. Radiolarians from Sabah and Sarawak E Jurassic- Cretaceous ages. Five hypersiliceous periods, related to volcanism: Late Devonian-E Carboniferous, Permian, Triassic, E Jurassic and Late Jurassic-Cretaceous)

Kanmera, K. (1964)- Triassic coral faunas from the Konose Group in Kyushu. Memoirs Faculty of Science, Kyushu University, Ser. D, Geology, 15, 1, p. 117-147.
(online at: https://catalog.lib.kyushu-u.ac.jp/opac_download_md/1543615/15_01_p117.pdf)
(Corals from U Triassic U Konose Gp in the southern accretionary belt of Japan (Pacific seamount limestones). associated with common basic volcanoclastics. Close affinities to (Tethyan) Norian-Rhaetian corals of Austrian

Alps and from Timor (author mentions species previously known only from Timor;like Montlivaltia timorica, M. norica, JTvG))

Kobayashi, F., R. Martini & L. Zaninetti (2005)- Anisian foraminifers from allochthonous limestones of the Tanoura formation (Kurosegawa Terrane, West Kyushu, Japan). Geobios 38, 6, p. 751-763.
(35 species of M Triassic foraminifera in allochthonous oolitic limestone blocks in Carnian Tanoura Fm in Kurosegawa Terrane of W Kyushu. Blocks of Anisian in age, based on Pilammina densa and Meandrospira dinarica, associated with Triadodiscus, Aulotortus, etc. Terrane was part of N Gondwana margin, then isolated eastwards before E Cretaceous amalgamation with S China in E Cretaceous)

Kobayashi, T. & T. Kimura (1944)- A study on the radiolarian rocks. J. Faculty of Science, Imperial University of Tokyo, Section 2, 7, 2, p. 75-187.
(Includes review of Paleozoic- Mesozoic radiolaria data from Sumatra, Kalimantan, etc. Kalimantan Danau Fm radiolaria transitional between Jurassic and Carboniferous faunas, therefore possibly more likely of Triassic age. Cherts in Tuhul Fm of S Sumatra are M-L Triassic or Permo-Triassic in age)

Kobayashi, T. & M. Tamura (1983)- On the Oriental Province of the Tethyan Realm in the Triassic Period. Proc. of the Japan Academy, Series B, 59, 7, p. 203-206.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/59/7/59_7_203/_pdf/-char/en)
(Short paper on provinciality in Triassic bivalves. In addition to cosmopolitans, many Triassic bivalve genera are distributed from Alps to China, Indochina and USSR. Oriental Province of Tethys with species indigenous to E and SE Asia. Stretches from Kashmir, Burma, S China, Malay Peninsula, to E Indonesia. Krumbeckia Diener 1908 is known from Upper Triassic in Sumatra and Yunnan. No maps)

Kobayashi, T. & M. Tamura (1983)- The Arcto-Pacific Realm and the Trigoniidae in the Triassic Period. Proc. of the Japan Academy, Series B, 59, 7, p. 207-210.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/59/7/59_7_207/_pdf/-char/en)
(Family Trigoniidae evolved from Myophoriidae polyphyletically in M and Late Triassic. Triassic bivalves of New Zealand, New Caledonia and New Guinea constitute distinct fauna. U Triassic cosmopolitan genus Monotis with paleogeographically restricted species; Borneo is junction of three Monotis seas: (1) M. salinaria group, distributed from Europe-Himalaya to Borneo; (2) M. ochotica group from Siberia to Borneo through Japan and (3) M. subcircularis group from Canada to New Zealand and Borneo through E Pacific coast. No figures)

(Synthesis of Triassic foraminifera and correlation between European and Asian domains)

XI.6. Paleozoic

Numerous additional papers with Paleozoic biostratigraphy content that are case studies specific to certain areas, are listed under those areas, and are not repeated here.

This chapter does include several papers on Paleozoic faunas-floras outside Indonesia that may help in the interpretation of related occurrences in Indonesia.

Permian stratigraphies and fossils are particulary useful for distinguishing higher latitude Gondwanan terranes (with Early Permian glacial deposits, Glossopteris flora, Eurydesma mollusc fauna,etc.), separated by the Paleotethys Ocean from low latitude Asian (Cathaysian) terranes during Permian time, as well as the 'Cimmerian ribbon terranes' (Sibumasu- Baoshan- Qiangtang) that rifted off Gondwana during the Early Permian opening of the Mesotethys Ocean.

Remarkable occurrences of 'East Paleotethys- Panthalassan' low-latitude Middle? Permian low-latitude fusulinid limestones deposited on basic seamount volcanics, now found from West Sumatra to Timor(?), Japan, New Zealand and NW North America

Aitchison, J.C., N. Suzuki, M. Caridroit, T. Danelian & P. Noble (2017)- Paleozoic radiolarian biostratigraphy. Geodiversitas 39, 3, p. 501-532.
(online at: https://sciencepress.mnhn.fr/sites/default/files/articles/pdf/geodiversitas-2017-n3a5-biostratigraphy-of-paleozoic-radiolarian-genera.pdf)
(Paleozoic (Cambrian-Permian) radiolarian biostratigraphy, with references to papers from Thailand, etc. (see also companion papers in same Geodiversitas volume 39, by Noble, Caridroit))

Archbold, N.W. (1983)- West Australian Permian brachiopoda: their taxonomy, biostratigraphy and provincialism; with an Appendix of published articles including a description of Permian brachiopoda from Irian Jaya, Indonesia. Ph.D. Dissertation, University of Melbourne, 2 vols.

Archbold, N.W. (2001)- Permian Productida of Australasia: palaeobiogeographical and palaeoclimatological implications. In: S.L. Long et al. (eds.) Brachiopods, Chapter 37, CRC Press, p. 363-371.
(Permian Productid brachiopods few genera in common between Westralian (rel. warm, S Tethys margin) and Austrazean (colder water, mainly endemics, strong links with New Zealand) provinces)

Archbold, N.W. & T. Hogeboom (2000)- Subsurface brachiopoda from borehole cores through the Early Permian sequence of the Carnarvon Basin, Western Australia: correlations with palynological biostratigraphy. Proc. Royal Society of Victoria 112, 1, p. 93-109.
(Early Permian brachiopods from five wells in onshore Carnarvon Basin, tied to spore-pollen zonation. Four earliest Permian brachiopod zones of W Australia (Lyonia lyoni, Trigonotreta occidentalis, Strophalosia irwinensis and Strophalosia jimbaensis zones, in ascending order) correlated with palynological zones (Granulatisporites confluens, Pseudoreticulatispora pseudoreticulata, Striatopodocarpites fusus, Didecitriletes byroensis and Microbaculispora trisina zones, in ascending order))

Asama, K., A. Hongnusonthi, J. Iwai, E. Kon'no, S.S. Rajah & M. Veeraburas (1975)- Summary of the Carboniferous and Permian plants from Thailand, Malaysia and adjacent areas. In: T. Kobayashi & R. Toriyama (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 15, p. 77-101.
(online at: http://library.dmr.go.th/library/DMR_Technical_Reports/1975/324.pdf)
(Oldest plants in SE Asia from Lower Carboniferous: known from Malaysia only (Kuantan flora, with Lepidodendron, on E Malaya Block). Five known Permian floras. Permian Jambi flora of Sumatra greatest similarities with Artinskian-Kungarian Shansi Fm of N China. Four other U Permian Cathaysian floras with Gigantopteris: Linggiu and Jengka floras from E Malay Peninsula; Phetchabun and Loei floras of N Thailand. Permian plants from W New Guinea are Gondwana-type flora, but some apparent Cathaysian elements)

Belasky, P. (1994)- Biogeography of Permian corals and the determination of longitude in tectonic reconstructions of the Paleopacific region. Canadian Society of Petroleum Geologists, Special Publ., p. 621-646.
(Mainly focused on American terranes. South China was center of diversity of Permian Tethyan coral province and was located near Permian Equator and W margin of Paleopacific Ocean)

BouDagher-Fadel, M.K. (2008)- The Palaeozoic larger benthic foraminifera: the Carboniferous and Permian. In: Evolution and geological significance of larger benthic foraminifera, Chapter 2, Developments in Palaeontology and Stratigraphy, Elsevier, 21, p. 39-118.
(General review of Paleozoic larger foraminifera, mainly Carboniferous-Permian fusulinids. End of Permian is major extinction event)

Bronnimann, P., J.E. Whittaker & L. Zaninetti (1978)- *Shanita*, a new pillared Miliocean foraminifera from the Late Permian of Burma and Thailand. Rivista Italiana Paleontologia 84, p. 63-92.
(New late Middle- Late Permian pillared miliolid Shanita amosi from W margin of Shan Plateau, E Myanmar. Species believed to be mainly characteristic of M Permian of Sibumasu/ Cimmerian terranes)

Broutin, J., J. Yu, X. Shi, W. Shu & X. Qing (2020)- Terrestrial palaeofloral succession across the Permian-Triassic boundary in the North and South China blocks: a brief review. Palaontologische Zeitschrift 94, p. 633-644.
(From Late Cisuralian (E Permian) to M Lopingian, N and S China blocks located in the equatorial domain. Both with homogeneous 'Cathaysian Palaeoflora', resulting from Cisuralian southern extension and diversification from northern cradle of Cathaysian plants to South. Progressive change in floral successions due to N-ward drift of N China block, while S China block remained in sub-equatorial domain)

Cantrill, R.C. (2003)- Aspects of Ordovician conodonts and the stratigraphy of Thailand, Malaysia, and Tasmania. Ph.D. Thesis, University of Tasmania, p. 1-158.
(online at: http://eprints.utas.edu.au/19158/1/whole_CantrillRobinCrawford2003_thesis.pdf)
(Incl. Ordovician conodonts from shallow tropical Lower Setul Lst from Langkawi Island (Tremadoc- Ashgill), Thung Song Lst of mainland Thailand and Ko Tarutao, Karmberg Lst of central S Tasmania)

Cantrill, R.C. & C. Burrett (2003)- The Greater Gondwana distribution of the Ordovician conodont *Panderodus nogamii* (Lee) 1975. Courier Forschungsinstitut Senckenberg, Frankfurt, 245, 1, p. 407-421.
(Panderodus nogamii (formerly Scolopodus nogamii), first described from N Korea, also in Lower Ordovician of Thailand, Malaysia, N and S China, Australia and Argentina. It ranged through Middle- early Late Ordovician and was restricted to shallow water carbonates in tropical- subtropical paleolatitudes of Greater Gondwana)

Caridroit, M., T. Danelian, L. O'Dogherty, J. Cuvelier, J.C. Aitchison, L. Pouille, P. Noble et al. (2017)- An illustrated catalogue and revised classification of Paleozoic radiolarian genera. Geodiversitas 39, 3, p. 363-417.
(online at: https://sciencepress.mnhn.fr/sites/default/files/articles/pdf/geodiversitas-2017-n3a3-catalogue-of-paleozoic-radiolarians_0.pdf)

Chapman, F. & W.J. Parr (1937)- On the discovery of fusulinid foraminifera in the Upper Palaeozoic of Northwest Australia. Victorian Naturalist 53, p. 175-179.
(Describe presence of fusulinid genera Verbeekina and Neoschwagerina in NW Australia. Identifications were later shown to be erroneous, they are fish remains (Crespin 1958, Quilty 1975) (still no fusulinid forams recorded yet from Australia, but are present on Timorisland and also in Birds Head of New Guinea; JTvG)

Cleal, C.J. (2017)- A global review of Permian macrofloral biostratigraphical schemes. In: S.G. Lucas & S.Z. Shen (eds.) The Permian Timescale, Geological Society, London, Special Publ. 450, p. 349-363.
(Incl. mention of Djambi flora of Sumatra, which may be regarded as transitional flora with taxa characteristic of both Euramerica (e.g. medullosaleans and marattialean ferns) and Cathaysia (e.g. Tingia, Cathaysiodendron) plant Paleokingdoms)

De D. Hornibrook, N. (1951)- Permian fusulinid foraminifera from the North Auckland Peninsula, New Zealand. Trans. Royal Society of New Zealand 79, 2, p. 319-321.
(online at: http://rsnz.natlib.govt.nz/volume/rsnz_79/rsnz_79_02_004230.pdf)
(Permian fusulinid foraminifera from limestone blocks associated with spilitic pillow lavas from Whangaroa Harbour, North Island, are first record of fusulines from New Zealand. Verbeekina, Neoschwagerina margaritae,

Yabeina multiseptata probably of M Permian (Wordian- Capitanian) age (and signify non-Gondwana low latitude; JTvG))

De Neve, G.A. (1961)- Correlation of fusulinid rocks from southern Sumatra, Bangka, and Borneo, with similar rocks from Malaya, Thailand and Burma. Proc. 9th Pacific Science Congress, Bangkok 1957, Geology and Geophysics 12, p. 249. *(Abstract only)*
(Four occurrences of U. Paleozoic rocks with fusulinids in Indonesia, incl. Sumatra localities of limestone with Neoschwagerina and Fusulina spp. in Palembang area, S Sumatra, (3a) E of Bukit Pendopo, discovered by Keil and (3b) 18 km W of Palembang, in Sekaju area pebbles with fusulinids in Old Neogene conglomerate by Van Tuijn (1931))

Dickins, J.M. (1956)- Permian pelecypods from the Carnarvon Basin, Western Australia. Bureau Mineral Resources Geology Geophysics, Bull. 29, p. 1-42.
(online at: https://s3-ap-southeast-2.amazonaws.com/corpdata/224/Bull_029.pdf)
(Documentation of Permian bivalve molluscs from northern Gondwana margin in NW Australia)

Dickins, J.M. (1957)- Permian pelecypods and gastropods from the Carnarvon Basin, Western Australia. Bureau Mineral Resources Geology Geophysics, Bull. 41, p. 1-75.
(online at: https://d28rz98at9flks.cloudfront.net/173/Bull_063.pdf)
(More documentation of Permian bivalve molluscs from northern Gondwana margin in NW and W Australia. Including the supposedly cool-water genus Atomodesma spp.))

Dickins, J.M. (1963)- Permian pelecypods and gastropods from Western Australia. Bureau Mineral Resources Geology Geophysics, Bull. 63, p. 1-203.
(online at: https://d28rz98at9flks.cloudfront.net/173/Bull_063.pdf)
(>150 species of pelecypods and 60 gastropods from 'Gondwanan' Permian of Carnarvon Basin and Canning/ Fitzroy Basins. Lower Permian four stages, lower stage characterized by 'Eurydesma fauna')

Edgell, H.S. (2004)- Upper Devonian and Lower Carboniferous Foraminifera from the Canning Basin, Western Australia. Micropaleontology 50, p. 1-26.
(Foraminifera from U Devonian reef complex and overlying Lower Carboniferous in N Canning Basin of NW Australia 20 species of tournayellids and endothyrids. Striking resemblance to microfaunas of Russia, Kazakhstan and South China)

Fortey, R.A. & L.R.M. Cocks (1986)- Marginal faunal belts and their structural implications, with examples from the Lower Palaeozoic. J. Geological Society, London, 143, p. 151-160.
(Record of Ordovician (Llanvirn) graptolites in Heluk River, E Irian Jaya (4°25'S, 139°17'E). Assigned to isograptid biofacies and taken as evidence of Ordovician ocean margin here. Oldest fossils in Indonesia ?)

Foster, C.B. (1982)- Spore-pollen assemblages of the Bowen Basin, Queensland (Australia): their relationship to the Permian/Triassic boundary. Review Palaeobotany Palynology 36, p. 165-183.
(Five palynofloral zones in M Permian- E Triassic of Bowen Basin, from old to young: 'Upper Stage 5' (= Dulhuntyipora zone of authors; commonly associated with Glossopteris); Playfordiaspora crenulata Zone (M Permian; = youngest coal seams and with last known Glossopteris), Protohaploxypinus microcorpus Zone (also with P. samoilovichii), Lunatisporites pellucidus Zone (also contains Falcisporites= Alisporites?; latest Permian or E Triassic?) and Protohaploxypinus samoilovichii Zone (= E Triassic). No range charts (Morante 1996 suggests Base P. microcorpus is ~Base E Triassic = base of Mt Goodwin shale in Bonaparte basin)

Foster, C.B., G.A. Logan, R.E. Summons, J.D. Gorter & D.S. Edwards (1997)- Carbon isotopes, kerogen types and the Permian-Triassic boundary in Australia: implications for exploration. The APPEA Journal 37, p. 472-489.
(Permian- Triassic boundary characterized by massive extinction of marine fauna. In non-marine sections in E Australia, top of coal measures used as top Permian. Carbon isotopic (δ13C) shift of either organic matter or carbonates may be used to delimit P-T boundary)

Furnish, W.M. & B.F. Glenister (1970)- Permian ammonoid *Cyclolobus* from the Salt Range, West Pakistan. In: Stratigraphic boundary problems: Permian and Triassic of West Pakistan, p. 153-175.
(On M Permian ammonite Cyclolobus, incl. mentions of occurrences in Basleo and Ruasnain, W Timor)

Gerth, H. (1931)- Porifera. In:B.G. Escher et al. (eds.) Onze palaeontologische kennis van Nederlandsch Oost Indie, Leidsche Geologische Mededelingen 5 (Feestbundel K. Martin), p. 115-119.
(online at: www.repository.naturalis.nl/document/549435)
(Porifera (sponges) chapter in 'Our paleontological knowledge of the Netherlands East Indies'. Isolated sponge needles known from various formations in Indonesia, but whole sponges mainly known from Permian and Triassic of Timor. Permian of Timor 25 species, mainly siliceous sponges. Triassic of Timor mainly calcareous sponges. No figures)

Gobbett, D.J. (1967)- Palaeozoogeography of the Verbeekinidae (Permian foraminifera). In: C.G. Adams & D.V. Ager (eds.) Aspects of Tethyan biogeography: A Symposium, The Systematics Association, London, Special Publication 7, p. 77-91.
(Fusulinid formifera of Verbeekinidae family largely restricted to M Permian of Tethys seaway. In Malaya and Hapan (and ASumatra; JTvG) verbeekinid limestones are associated with volcanics. With M Permian distribution map from Mediterranean area, through the Asia Minor-C Asian Tethyan belt to SE Asia and Japan. In Indonesia limited to Neoschwagerina fauna in Sumatra and Timor)

Gould, R.E. (1975)- The succession of Australian Pre-Tertiary megafossil floras. The Botanical Review 41, 4, p. 453-483.
(Review of Devonian- Cretaceous floras of Australia, incl. Devonian Baragwanathia flora, Permian Glossopteris flora, Triassic Dicroidium flora, etc.)

Hahn, G. & C. Brauckmann (1975)- Revision zweier Trilobiten Arten aus dem Perm Asiens. Geologica et Palaeontologica 9, p. 117-124.
('Revision of two trilobite species from the Permian of Asia'. With distinction of new subgenus of Pseudophillipsia (Carniphillipsia))

Hayasaka, I. (1917)- On the brachiopod genus *Lyttonia* with several Japanese and Chinese examples. J. Geological Society Japan, Tokyo, 24, 288, p. 43-53.
(online at: https://www.jstage.jst.go.jp/article/geosoc1893/24/288/24_288_43/_pdf/-char/en)
(Discussion of Permian brachiopods of Lyttonia/ Leptodus type in Japan and China and Indochina (also known from Sumatra, Malay Peninsula, Timor, etc.; JTvG)

Heritsch, F. (1937)- Die rugosen Korallen und die Stratigraphie der Permformation. In: F.E. Suess Festschrift, Mitteilungen der Geologischen Gesellschaft in Wien, 29, p. 307-328.
(online at: https://www.zobodat.at/pdf/MittGeolGes_29_0307-0328.pdf)
('The rugose corals and the stratigraphy of the Permian'. Review of Permian coral zonation, including discussion of M Permian Basleo coral fauna of Timor, as first described by Gerth (1921))

Heritsch, F. (1937)- Rugose Korallen aus dem Salt Range, aus Timor und aus Djoulfa, mit Bemerkungen uber die Stratigraphie des Perms. Sitzungsberichte Akademie Wissenschaften, Wien, Math.- Naturwissenschaftliche Klasse, Abt. 1, 146, p. 1-16.
('Rugose corals from the Salt Range (Himalaya), from Timor and from Djoulfa, with remarks on the stratigraphy of the Permian'. Brief descriptions of some Permian rugose corals)

Hess, H. (1999)- Permian. In: H. Hess et al. (eds.) Fossil crinoids, Cambridge University Press, Chapter 20, p. 160-165.
(Timor Permian crinoid faunas most diverse and abundant in world, with 320 species described by Wanner, most new and unique to Timor. Permian crinoids from Australia cooler water faunas, with much lower diversity than Timor faunas)

Hill, D. (1957)- The sequence and distribution of Upper Palaeozoic coral faunas. Australian J. Science 19, p. 42-61.
(Review of Permian corals, including Timor material)

Igo, H. (1984)- Summary of the Palaeozoic conodonts from Malaysia and Thailand. In: T. Kobayashi, R. Toriyama & W. Hashimoto (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 25, p. 289-293.
(Brief review of Paleozoic conodonts in SE Asia. Oldest conodonts are of Ordovician age, from S Thailand)

Ishii, K.I. (1975)- On the genus *Colaniella* and its biostratigraphic significance. J. Geosciences, Osaka City University 19, 6, p. 107-138.
(online at: http://dlisv03.media.osaka-cu.ac.jp/infolib/user_contents/kiyo/DBe0190006.pdf)
Small latest Permian benthic foram genus Colaniella, generally associated with fusulinids (Palaeofusulina, Reichelina, Staffella) and small foraminifera (Pachyphloia, Globivalvulina, Agathammina, Endothyra, etc.). Common in Japan, S China, Himalayas, Mediterranean, also in Thailand, Malay Peninsula (Kelantan))

Ishii, K., Y. Okimura & K. Ichikawa (1985)- Notes on Tethys biogeography with reference to Middle Permian fusulinaceans. In: K. Nakazawa & J.M. Dickins (eds.) The Tethys: her paleogeography and paleobiogeography from Paleozoic to Mesozoic, Tokai University Press, Tokyo, p. 139-155.

Isozaki, Y. (2006)- Guadalupian (Middle Permian) giant bivalve Alatoconchidae from a mid-Panthalssan paleo-atoll complex in Kyushu, Japan: a unique community associated with Tethyan fusulines and corals. Proc. of the Japan Academy, B82, 1, p. 25-32.
(online at: http://ea.c.u-tokyo.ac.jp/earth/Members/Isozaki/06Alatoconchidae.pdf)
(Large Alatoconchidae bivalves in M Permian, with typical Tethyan fusulinids of Neoschwagerina and Lepidolina zones. Range up to end-Guadalupian extinction level)

Isozaki, Y. & D. Aljinovic (2009)- End-Guadalupian extinction of the Permian gigantic bivalve Alatoconchidae: end of gigantism in tropical seas by cooling. Palaeogeogr. Palaeoclim. Palaeoecology 284, p. 11-21.
(Large, thick Permian Alatoconchidae bivalves from E-M Permian shallow-marine carbonates in 9 areas in low-latitudes of Tethyan and Panthalassan domains, incl. Thailand, Malaysia, Philippines, and Japan. Always in association with large fusulines (Verbeekinidae) and/or rugose corals (Waagenophyllidae). This 'tropical trio' became extinct near Guadalupian-Lopingian boundary, probably due to temperature drop (Kamura cooling))

Kanmera, K., K. Ishii & R. Toriyama (1976)- The evolution and extinction patterns of Permian Fusulinaceans. In: T. Kobayashi & W. Hashimoto (eds.) Geology and Palaeontology of Southeast Asia, University of Tokyo Press, 17, p. 129-154.
(Review of parallel evolution of several lineages of fusulinid foraminifera, each with short periods of rapid diversification, interspersed with longer periods of relative stability. No sudden and catastrophic extinctions of fusulinaceans, but gradual waning of group through later Permian)

Kawamura, T. & H. Machiyama (1995)- A Late Permian coral reef complex, South Kitakami Terrane, Japan. Sedimentary Geology 99, p. 135-150.
(M Permian Iwaizaki Lst of S Kitakami Terrane in NE Japan, represents coral reef complex. With rugose and tabulate corals, solenoporacean algae, calcisponges, Tubiphytes, Archaeolithoporella, etc. High diversity unique among Permian reefs, most of which are mainly formed by calcisponges and calcareous algae. Coral reefs developed mainly around S China and Indochina continents, in tropics. Calcisponge reefs and Tubiphytes-algal crust reefs common in tropical- subtropical regions; stromatolite-bryozoan reefs in arid areas)

Kemp, E.M., B.E. Balme, R.J. Helby, R.A. Kyle, G. Playford & P.L. Price (1977)- Carboniferous and Permian palynostratigraphy in Australia and Antarctica: a review. BMR J. Australian Geology Geophysics 2, p. 177-208.
(online at: www.ga.gov.au/corporate_data/80927/Jou1977_v2_n3_p177.pdf)

Kobayashi, F. (2005)- Permian foraminifers from the Itsukaichi-Ome area, West Tokyo, Japan. Journal of Paleontology 79, 3, p. 413-432.
(Continuous carbonate deposition of >70 My on Panthalassan buildup in Carboniferous-Permian limestone blocks in Itsukaichi- Ome area. Blocks and breccias resulted from collapse of seamount and tectonic mixing with trench-fill deposits in Jurassic accretionary complexes of Chichibu Terrane. 105 species of Permian and 65 species of Carboniferous forms in 24 fusulinacean zones)

Kobayashi, F. (2011)- Permian fusuline faunas and biostratigraphy of the Akasaka Limestone (Japan). Revue de Paleobiologie, Geneve, 30, 2, p. 431-574.
(online at: www.ville-ge.ch/mhng/paleo/paleo-pdf/30-2/pal_30_2_01a.pdf)
(Mainly M Permian Akasaka Lst in C Japan with 63 species of fusulinids, divided into 7 zones: Parafusulina nakamigawai (U Kungurian), Cancellina nipponica (Lw Roadian), Neoschwagerina simplex (U Roadian), N. craticulifera (Lw Wordian), N. colaniae (U Wordian) Yabeina globosa (Capitanian) and Nanlingella suzukii Zone (Wuchiapingian))

Kobayashi, F. (2012)- Permian non-fusuline foraminifers of the Akasaka Limestone (Japan). Revue de Paleobiologie, Geneve, 31, 2, p. 313-335.
(online at: www.ville-ge.ch/mhng/paleo/paleo-pdf/31-2/pal_31_2_03.pdf)
(Description of diverse Permian smaller foram assemblages with Tethyan affinities, from 250m thick Akasaka Lst, deposited on Permian Panthalassan seamount and emplaced as exotic block in Jurassic-E Cretaceous accretionary complexes of Mino Terrane in C Japan. Associated with rich fusulinid assemblages, with 7 zones.)

Kobayashi, F. (2012)- Middle and Late Permian foraminifers from the Chichibu Belt, Takachiho Area, Kyushu, Japan: implications for faunal events. Journal of Paleontology 86, p. 669-687.
(M-L Permian- Triassic carbonates (<100m thick?) with fusulinids in S Chichibu Belt of C Kyushu, originated as Panthalassan seamount, now in ?Jurassic accretionary complex. Permian (Guadalupian-Lopingian) and Triassic ages)

Kobayashi, F., C.A. Ross & J.R.P. Ross (2010)- *Thailandina* and *Neothailandina*, and their subfamily Thailandininae: an example of an invalid taxonomic group of Permian fusuline foraminifera. Journal of Paleontology 84, 2, p. 360-361.
(Thailandina and Neothailandina genera of Permian fusulinids from Rat Buri Limestone in Thailand first proposed by Toriyama and Kanmera (1968), based on unique wall structure. However, thailandina-type wall is secondary mineralization of calcite as seen in specimens of Staffellidae, Misellina, etc.)

Kobayashi, T. & T. Hamada (1978)- Three suites of Carboniferous trilobites in Southeast Asia. Proc. of the Japan Academy, Series B, 54, 3, p. 92-95.
(online at: https://www.jstage.jst.go.jp/article/pjab1977/54/3/54_3_92/_pdf)
(18 species of trilobites known from Carboniferous of SE Asia. Oldest assemblage in Langgon Red Beds in NW Malay Peninsula (Langgonbole, Waribole, Macrobole, etc.). Younger assemblage (Dinantian) with Linguphillipsia (= Phillipsia of older authors?))

Krassilov, V.A. (2000)- Permian phytogeographic zonality and its implications for continental position and climates. Paleontological Journal (Moscow) 34, Supplement 1, p. 587-598.
(online at: http://paleobotany.ru/pdf/Krassilov%202000%20-%20Permian%20Phytogeographic%20Zonality%20and%20Its.pdf)
(Revised scheme of Permian plant geography. Contrary to prevalent opinion views Sumatra (Jambi) and West Irian Jaya floras as 'mixed Eurogondwana' floras, and mapped in 'subtropical humothermic belt' with 'Gondwanan' India- Australia floras)

Krijnen, W.F. (1931)- Palaeozoic and Mesozoic Gastropoda, Lamellibranchiata and Scaphopoda. In: B.G. Escher et al. (eds.) De palaeontologie en stratigraphie van Nederlandsch Oost-Indie, Leidsche Geologische Mededelingen 5 (K. Martin Memorial Volume), p. 164-205.
(online at: www.repository.naturalis.nl/document/549430)

(Extensive listings of Paleozoic- Mesozoic molluscs (gastropods, bivalves) known from Indonesia in 1931. No figures)

Laveine, J.P., S. Zhang & Y. Lemoigne (2003)- Additional documentation to the knowledge of the Late Palaeozoic floras of East and Southeast Asia: general conclusions and references. Revue de Paleobiologie, Geneve, 22, p. 831-849.
(Floras suggest that Indochina, E Malaysia, and S and N China were closely connected during Carboniferous)

Leven, E.Y. (1997)- Permian stratigraphy and fusulinida of Afghanistan with their paleotectonic implications. Geological Society of America (GSA), Special Paper 316, p. 1-134.
(Complete Permian section in Afghanistan, with rich fusulinid faunas: 58 genera, 282 species, incl. 41 new. Asselian- Sakmarian in N Afghanistan and N Pamir tropical shelf carbonates and fusulinid assemblages. Age-equivalent rocks of S Afghanistan- S Pamir all siliciclastic, lacking fusulinids, with cold-water macrofaunas typical of Peri-Gondwanan seas. In S Afghanistan first fusulinids in Sakmarian, low diversity, mainly species of Pseudofusulina. By late Yahtashian- Bolorian (late E Permian= ~late Artinskian-Kungurian; JTvG), due to milder climate and widespread transgression, distinction between S and N fusulinid assemblages starts to disappear. In C-S Afghanistan occurrences of Monodiexodina in Bolorian (= Kungurian; late E Permian), Neoschwagerina- Verbeekina- Sumatrina in Murgabian-Midian (M Permian) and miliolid Shanita amosi-Hemigordiopsis renz in Midian-Dzhulfian (M-L Permian))

Leven, E.Y. (2003)- The Permian stratigraphy and Fusulinids of the Tethys. Rivista Italiana Paleontologia Stratigrafia 109, 2, p. 267-280.
(online at: https://riviste.unimi.it/index.php/RIPS/article/view/5507/5553)

Leven, E.J. & H.J. Campbell (1998)- Middle Permian (Murgabian) fusuline faunas, Torlesse Terrane, New Zealand. New Zealand J. Geology Geophysics 41, p. 149-156.
(online at: www.tandfonline.com/doi/pdf/10.1080/00288306.1998.9514799)
(Two fusuline foram limestone localities in Torlesse Gp of Canterbury, S Island, New Zealand. Limestones associated with volcanics and hemipelagic sediments which appear 'allochthonous' (fortuitous accumulations associated with oceanic seamounts). Low diversity fauna dominated by Parafusulina (Skinnerella) japonica, also Parafusulina (S.) cuniculata. Fauna correlates best with late M Permian (E Murgabian) sequences of Tethyan affinity in Eurasia)

Leven, E.J. & J.A. Grant-Mackie (1997)- Permian fusulinid foraminifera from Wherowhero Point, Orua Bay, Northland, New Zealand. New Zealand J. Geology Geophysics 40, p. 473-486.
(online at: www.tandfonline.com/doi/pdf/10.1080/00288306.1997.9514777)
(Abundant, diverse E-M Midian fusulinids (24 species) from Waipapa Terrane, N Island. Probably East Paleotethys-Panthalassa seamount fauna. Key species Neoschwagerina margaritae, Yabeina spp, Reichelina sp, Lepidolina shiraiwensis, etc. Much more diverse than Murgabian faunas from Torlesse, S Island)

Long, J.A. (1990)- Late Devonian Chondrichthyans and other microvertebrate remains from Northern Thailand. J. Vertebrate Paleontology 10, 1, p. 59-71.
(Microvertebrates from limestones near Burmese border town of Mae Sam Lap, N Thailand, dated as Late Famennian by conodonts. Fauna contains chondrichthyans, several types of chondrichthyan scales, actinopterygian scales and teeth, and rare acanthodian scales. Taxa suggest close affinity between Shan-Thai, East Gondwana, and S China Terranes at end of Devonian)

Macurda, D.B. (1983)- Systematics of the fissiculate Blastoidea. University of Michigan Papers on Paleontology, Ann Arbor, 22, p. 1-291.
(Strictly taxonomic review of Permian blastoids, much of which based on Timor material. No location info, biostratigraphic succession, etc.)

Mamet, B.L. & E. Saurin (1970)- Sur la microfaune des foraminiferes carboniferes du Sud-est asiatique. Bull. Societe Geologique France (7) 12, 2, p. 356-363.

('On the Carboniferous foraminiferal microfauna of Southeast Asia'. Eight Carboniferous foram assemblages, similar to Europe/ Asia, described from Laos, Vietnam, Malaysia)

Martodjojo, Sujono (1964)- A study of the superfamily Adrianitaceae. Contributions Department of Geology, Institute of Technology Bandung (ITB) 58, p. 75-81.
(Two groups recognized in ?Permian ammonoid family, from Timor?)

McLoughlin, S. (1993)- Glossopterid megafossils in Permian Gondwanic non-marine biostratigraphy. In: R.H. Findlay et al. (eds.) Proc. Gondwana Eight- Assembly, evolution and dispersal, Balkema, Rotterdam, p. 253-264.
(Review of Permian Glossopteris floras, characteristic of Gondwana. NE Australian Strong provincialism: Bowen Basin Glossopteris present, but no species in common with Indian or South African successions))

McLoughlin, S. (1995)- New records of *Bergiopteris* and glossopterid fructifications from the Permian of Western Australia and Queensland. Alcheringa 19, 3, p. 175-192.

Metcalfe, I. & Y. Isozaki (2009)- Current perspectives on the Permian-Triassic boundary and end-Permian mass extinction: Preface. J. Asian Earth Sciences 36, p. 407-412.
(End-Permian mass extinction nowwell dated at 252.6 ± 0.2 Ma (U-Pb) and Permian-Triassic GSSP level is dated by interpolation at 252.5 Ma. Conodonts evolved rapidly in first 1 million years following mass extinction leading to high-resolution conodont zones. Nature of double-phased Late Permian extinction (at Guadalupian-Lopingian boundary and P-T boundary, linked to large igneous provinces, suggests superplume activity that involved geomagnetic polarity change and massive volcanism)

Morante, R. (1996)- Permian and early Triassic isotopic records of carbon and strontium in Australia and a scenario of events about the Permian-Triassic boundary. Historical Biology 11, p. 289-310.
(Organic carbon in wells in Australian basins showed negative d13C excursions of 6-10%, believed to correlate with negative d13C excursion in marine carbonates at Permian-Triassic boundary around world. Shift consistently near base of miospore Protohaploxypinus microcorpus Zone of Helby et al. (1987))

Nestell, M.K. & G.P. Pronina (1997)- The distribution and age of the genus *Hemigordiopsis*. In: C.A. Ross et al. (eds.) Late Paleozoic foraminifera; their biostratigraphy, evolution, and paleoecology; and the mid-Carboniferous boundary, Cushman Foundation Foraminiferal Research, Special Publ. 36, 3, p. 105-110.
(online at: https://www.academia.edu/62505006/The_Distribution_and_age_of_the_genus_Hemigordiopsis)
(M-L Permian (Late Midian) foraminifer Hemigordiopsis appears to be characteristic of 'Cimmerian' terranes (including Sibumasu) which rifted off N Gondwana margin in Permian, now as remnants in Tethyan belt from Mediterranean to Peninsular Thailand and W Malay Peninsula. Hemigordiopsis evolved into Shanita in Late Midian; both go extinct at end of Late Midian))

Newell Arber, E.A. (2005)- Catalogue of the fossil plants of the *Glossopteris* flora in the Department of Geology, British Museum (Natural History); being a monograph of the Permo-Carboniferous flora of India and the Southern Hemisphere. British Museum (Natural History). Dept. of Geology, London, p. 1-255.

('On the development of the oil industry and the processing of crude oil in the Netherlands Indies'. Brief review of history of oil exploration and refining in Netherlands East Indies, from the early days of the foundation of the Royal Dutch up to World War II, the nature of the crude oils and the refining methods and facilities. By 1940 oil production by only 2 companies: BPM-Shell (75%) and NKPM-Stanvac (25%), and 50% of all from S Sumatra)

Said, M. (1982)- Overview of exploration for petroleum in Malaysia under the Production Sharing Contracts. In: Offshore Southeast Asia 82 Conference, Singapore, SE Asia Petroleum Exploration Society (SEAPEX), p. 1-14.

Satyana, A.H. (2014)- Successful and prospective exploration play concepts of Indonesia: lessons from history and recent progress - anticipating future challenges. Proc. 38th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA14-G-276, p. 1-19.
(10 proven economic hydrocarbon play types in Indonesia: (1) Paleogene regressive clastics of Java- Sumatra- Kalimantan (Talang Akar, Tanjung); (2) Neogene regressive clastics of Java- Sumatra- Kalimantan (Wonocolo, Warukin); 3. Neogene deltaic complex of Kutai- Tarakan (Handil, Tarakan); (4) Neogene deep water clastics of Kutai- Tarakan (W Seno); (5) Oligo-Miocene carbonate platforms of Sumatra- Java (Kaji Semoga); (6) Neogene pinnacle reefs (Arun, Banyu Urip, Kasim); (7) Fractured volcanics of Sumatra- Java (Suban, Jatibarang); (8) Australian Mesozoic marginal rift grabens (Vorwata- Tangguh); (9) Neogene microcontinental collisions (Tiaka, Donggi- Senoro); (10) Neogene island arc- Australian passive margins (Oseil- Bula). Five additional play types with indications of hydrocarbons: (11) Subvolcanic North Serayu, C Java (Karangkobar- Cipluk); (12) Paleogene rifted structures of Makassar Straits (Kaluku type); (13) Neogene reefs of Sumatra- Java forearcs (Singkel Ibu Suma); (14) Papuan fold- thrust belt (Cross Catalina) and (15) N Papua Neogene volcanoclastic sediments (Niengo))

Satyana, A.H. (2016)- Review of Indonesia's petroleum exploration 2000-2015: where from. Proc. IPA 2016 Technical Symposium, Indonesia exploration: where from- where to, Indonesian Petroleum Association (IPA), Jakarta, 28-TS-16, p. 1-26.
(online at: www.academia.edu/43213647/REVIEW_OF_INDONESIA_S_PETROLEUM_EXPLORATI Etc.)
(In Indonesia 974 exploration and appraisal wells drilled from 2002-2015, 617 onshore and 357 offshore. Of 676 new field wildcats 310 encountered hydrocarbons, adding in-place resources of 18,500 MMBOE. Discoveries in W Indonesia in 5 plays: (1) Paleogene rift sections of Sumatra, W Java, W Natuna; (2) pre-Cenozoic fractured basement in S Sumatra, W Java, E Java; (3) Oligo-Miocene carbonate build ups of E Java and U Kutai; (4) Mio-Pliocene deep-water turbidites of N Makassar and Tarakan; (5) Mio-Pliocene growth-faults of delta progradation of Tarakan Basin. In E Indonesia in 2 plays (Jurassic and Miocene). With details on significant discoveries and dry wells)

Satyana, A.H. (2019)- Giant fields of Indonesia: play types, geologic factors, and prospectivities of future giant fields. Proc. 43rd Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA19-G-271, p. 1-33.
(online at: https://tektonesiana.org/2019/11/12/satyana-a-h-2019-giant-fields-of-indonesia-play-types-geologic-factors-and-prospectivities-of-future-giant-fields/)
(17 oil and gas fields of Indonesia classified as giant fields, in 6 play types)

Satyana, A.H. (2022)- The biggest risks in hydrocarbon exploration that are often overlooked: cases of exploration failures in Indonesia and the solutions. Proc. 46th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA22-G-312, p. 1-19.
(online at: https://tektonesiana.org/wp-content/uploads/2024/07/satyana-2022-ipa_big-risk-explor-hc.pdf)
(Hydrocarbon exploration failures are generally related to overlooking of some elements and processes of the petroleum system, including tendency to think of seismic low as a kitchen, being too optimistic in basin modelling, assuming that it is sufficient if kitchens have generated hydrocarbons whereas expulsion threshold is more critical, not mapping migration pathways in detail, and not evaluating carrier beds and regional sealing. Etc.)

Satyana, A.H., C. Armandita & J.A. Paju (2012)- Acceleration in regional exploration of Indonesia: requirement for survival. Proc. 36th Annual Conv. Indonesian Petroleum Association, Jakarta, IPA12-G-158, p. 1-14.
(online at: https://www.academia.edu/12104674/ACCELERATION_IN_REGIONAL_EXPLORATION_OF_INDONESIA_REQUIREMENT_FOR_SURVIVAL)
(Peak oil production in Indonesia was reached in 1977: production of 615 MM barrels oil (= 1.68 MMBO/ day. Exploration has been in serious decline for 15 years. Accelerated massive exploration required for survival of Indonesia as significant oil producer)

Schenk, C.J. (2012)- Assessment of undiscovered conventional oil and gas resources of Thailand. In: International Petroleum Technical Conference (IPTC), Bangkok, IPTC, p. 38-42.

(US Geological Survey estimated mean 1.6 billion barrels of undiscovered conventional oil and 17 trillion cubic feet of undiscovered conventional natural gas in three geologic provinces of Thailand. Most of undiscovered conventional oil and gas in offshore Thai Basin Province)

Schenk, C.J. (2012)- Potential unconventional oil and gas resource accumulations, Onshore Thailand. In: Int. Petroleum Technical Conference (IPTC), Bangkok 2012, p. 1-3. *(Extended Abstract)*
(Tight gas and shale gas accumulations may exist in Triassic clastics of Khorat Plateau Province. Shale oil and shale gas may be present in extensional structures in Thai Cenozoic Basins Province. Coalbed gas does not appear to be viable resource in N Thailand)

Schenk, C.J., M.E. Brownfield, R.R. Charpentier, T.A. Cook, T.R. Klett et al. (2010)- Assessment of undiscovered oil and gas Resources of SE Asia, 2010. U.S. Geological Survey (USGS) Fact Sheet 2010-3015, p. 1-4.
(online at: http://pubs.usgs.gov/fs/2010/3015/pdf/FS10-3015.pdf)
(SE Asia undiscovered conventional oil and gas resources in 23 geologic provinces. Oil mean total is 21.6 Billion BO (range 8.9- 41.6); gas mean total 299 TCFG (range 129- 557) and mean natural gas liquids 9.1 Billion barrels. About 70% of oil in 6 provinces: Baram Delta/Brunei-Sabah, Kutei, S China Sea Platform, E Java, Cuu Long and Thai Basins. About 60% of gas in 6 provinces: Kutei, Greater Sarawak Basin, East Java, Baram Delta/Brunei-Sabah, S China Sea and Nam Con Son Basin)

Schenk, C.J., M.E. Brownfield, R.R. Charpentier, T.A. Cook, T.R. Klett, J.K. Pitman & R.M. Pollastro (2012)- Assessment of undiscovered oil and gas resources of Papua New Guinea, eastern Indonesia, and East Timor, 2011. U.S. Geological Survey (USGS) Fact Sheet 2012-3029, 2p.
(online at: http://pubs.usgs.gov/fs/2012/3029/FS2012-3029.pdf)
(USGS assessed undiscovered conventional oil and gas in five geologic provinces of the PNG, E Indonesia, and E Timor: (1) oil mean total 5.78 MMBO (2) gas mean total is 115.2 BCFG. Of undiscovered oil 36% in Timor Thrust and Seram Thrust provinces, 37% in fold- thrust belts of PNG and Irian Jaya. Undiscovered Gas mean estimates for PNG Fold Belt 18.1 BCFG, Arafura Platform 15.9 BCFG and Bintuni Basin 20.8 BCFG)

Schuppli, H.M. (1946)- Oil basins of the East Indian Archipelago. American Assoc. Petroleum Geol. (AAPG) Bull. 30, p. 1-22.
(Oil fields of Tertiary basins of Sumatra, Java, and Borneo produced >1 billion barrels of oil to end of 1940. Oil produced almost exclusively from sands of Miocene and Pliocene age. Shortly before the Japanese invasion commercial accumulations discovered in Eocene beds. Bula field in Seram, probably produces Triassic oil, accumulated in overlapping Plio-Pleistocene sands)

('The distribution pattern of gas charged sediment in seabed of waters of Sidoarjo, East Java'. Belt of biogenic shallow gas-charged sediments on shallow seismic profiles off Porong Delta, Madura Straits)

Atkinson, C.D. & A. Livsey (2000)- Role of resinite in hydrocarbon generation from Indonesian coals. AAPG International Conference Exhib. Abstracts, American Assoc. Petroleum Geol. (AAPG) Bull. 84, 9, p. 1400.
(Abstract only) (Liptinite maceral 'resinite' important constituent of Tertiary coals in W Indonesia, probably from resins of Dipterocarp family tropical lowland trees. Samples from Miocene of Kutei Basin and Oligocene of Arjuna Basin (off NW Java) have abundant resinite, particularly in vitrinite-rich delta plain coals. Resinites hydrogen-rich, but not paraffinic, suggesting resinite not significant contributor to terrestrially-derived oils in these basins, but contribute cyclic hydrocarbons and biomarkers to these oils)

Barber, P.M. & J. Winterhalder (2013)- The Northern Australia- Eastern Indonesia- PNG Super Gas Province: why so much gas and so little oil? AAPG International Convention Exhib., Singapore 2012, Search and Discovery Article 10475, p. 1-32. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2013/10475barber/ndx_barber.pdf)
(N Australia-E Indonesia-PNG Gas Province of Late Paleozoic-Mesozoic age overwhelmingly gas-prone (80% of all hydrocarbons discovered to date). Distribution of oil- vs. gas-prone source rocks controlled by successive Permian-Mesozoic passive margin extension, rifting and breakup, overprinted by global eustatic cycles and tectonic interaction with W Papua-PNG foldbelt. Two major source rock types: (1) oil-prone Organofacies B (only in local Oxfordian-Kimmeridgian syn-rifts and PNG foreland basins); (2) Organofacies D/E much more widespread, in U Permian-Jurassic lower delta-plain coals)

Curiale, J. & J. Decker (2007)- Eocene oil-prone source rock potential of Central Indonesia. American Assoc. Petroleum Geol. (AAPG) Bull. 91, Program Abstracts 2007 AAPG Annual Convention Long Beach.
(Occurrence of oil-prone, terrigenous Eocene source potential in extensive areas of E Borneo and W Sulawesi, and oil-prone, lacustrine Eocene potential in S part Makassar Strait. Eocene-sourced oil accumulations known in Barito Basin (Tanjung Field). Extent of other Eocene-sourced accumulations (e.g., Tengkawang oil of E Kalimantan, surface seeps in SW Sulawesi, Pangkat oil tests in S Makassar Strait) not determined)

Curiale, J.A., J. Decker, C.A. Caughey & H.F. Schwing (2003)- Oil-prone lacustrine source rock potential in Central Indonesia. 2003 AAPG/ SEPM Convention, p. 35-36. *(Abstract only)*
(E Borneo and W Sulawesi oils show partial or total lacustrine signature. C Indonesian oils with partial or complete lacustrine signature include Pantai-1 (off E coast Borneo) and Pangkat-1 (S Makassar Strait). Both oils elevated 4-methylsteranes. Pangkat-1 oil with beta-carotane, elevated sulfur (S = 2.1%) and very light carbon isotope ratios (d13C = -30.3 ppm). Very low maturity levels, possibly early generation from Type I-S kerogen deposited in hypersaline setting. Other C Indonesian oils reveal lacustrine source signature indicating freshwater depositional setting. Paleogene rifting between Borneo and Sulawesi provided potential development of oil-prone lacustrine source rocks)

Curiale, J.A., E. Lumadyo & R. Lin (2002)- Petroleum and source rock geochemistry of the Salayar Basin (offshore Sulawesi), Indonesia. AAPG-SEPM Annual Convention, Houston 2002, p. *(Abstract only).*
(online at: https://www.searchanddiscovery.com/abstracts/pdf/2002/annual/SHORT/ndx_21622.pdf)
(Salayar Basin off SW Sulawesi, at S-most extent of Makassar Strait in Indonesia. Cretaceous- M Eocene rifting created Dewakang graben, followed by inversion through M Miocene. Depositional models and regional data suggest lacustrine, oil-prone sources in Paleocene, and oil-prone coaly sequences in M Eocene. Both source facies proven to E and NE at basin margins. Eocene 'Kelara Limestone' source for low-wax, low-asphaltene oil in basin center. Underlying Eocene coals- coaly shales analogous to oil-prone Barito Basin sapropelic coals, and responsible for oil seeps in SW Sulawesi. Possible occurrence of older, lacustrine oil-prone sources in Salayar Basin significant upside to exploration. Oil-prone sources mature in deepest parts of basin)

Curiale, J.A., P. Kyi, I.D. Collins, D. Aung, N. Kyaw, N.M. Nyunt & C.J. Stuart (1994)- The Central Myanmar (Burma) oil family-composition and implications for source. Organic Geochemistry 22, 2, p. 237-255.
(Geochemical characteristics of 31 Eocene-Miocene oils/seeps, Eocene coal and Eocene resin from C Myanmar suggest Eocene resinous shale/coal is source for oils)

Daulay, B. & H. Panggabean (2001)- Batubara sebagai sumber hidrokarbon: studi kasus cekungan Kutai dan Barito. Jurnal Geologi dan Sumberdaya Mineral (JGSM) 11, 118, p. 26-34.

Davis, R.C., S.W. Noon & J. Harrington (2004)- Influence of depositional environment on the petroleum potential of Tertiary Indonesian coals. Abstracts 21th Annual Meeting Soc. Organic Petrology, Sydney, 21, p. 61-63.
(see more extensive version, below)

Davis, R.C., S.W. Noon & J. Harrington (2007)- The petroleum potential of Tertiary coals from Western Indonesia: relationship to mire type and sequence stratigraphic setting. Int. J. Coal Geology 70, p. 35-52.
(online at: www.academia.edu/79203303/The_petroleum_potential_of_Tertiary_coals_from_Western_I Etc.)
(500 deltaic sediments analysed from 14 basins in W Indonesia. Main peat-forming episodes: (1) Paleogene syn-rift transgressive, (2) Paleogene-Neogene post-rift transgressive, (3) Neogene regressive. Paleogene syn-rift coals more hydrogen-rich than Neogene coals and more oil-prone. Pliocene coals from regressive sequence in Sumatran fore-arc very hydrogen-poor. Systematic increase in HI with increasing rank suggests pyrolysis underestimates petroleum potential in low rank coals. Vitrinite type more important for petroleum potential than liptinite content. Four coal sub-types: I, II and III low ash coals and likely deposited in raised mires. Sub-type IV

hydrogen-rich, high-ash Eocene coals, deposited in submerged mire. Highly degraded peats result in hydrogen-rich coals with higher proportion of detrital vitrinite. Degree of degradation related to time peat spends in zone of influence of water table; unlikely related to tectonostratigraphic setting)

Doust, H. (2017)- Petroleum systems in Southeast Asian Tertiary basins. Bull. Geological Society Malaysia 64 (50th Anniversary Issue 2), p. 1-16.
(online at: https://gsmpubl.wordpress.com/wp-content/uploads/2018/08/bgsm201708.pdf)
(Productive Tertiary basins in SE Asia similar geodynamic developments, with 5 facies associations: (1) lacustrine (early synrift of Sundaland; mainly oil) (2) paralic (late synrift); (3) open marine shelf (post-rift, E Indonesia and Philippines) (4) deeper marine (post-rift; mainly gas) and (5) pre-Tertiary (E Indonesia and Thailand, mainly terrestrial). Around Borneo thick late postrift passive margin delta sequences with oil- and gas-prone coaly source rock; transported terrigenous organic material common in related deep marine environments and contributes to marine source facies. In SE Asia terrestrial and lacustrine source rocks rel. difficult to locate, variable in quality and often distributed in thin beds)

Doust, H. & G. Lijmbach (1997)- Charge constraints on the hydrocarbon habitat and development of hydrocarbon systems in Southeast Asia Tertiary Basin. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Int. Conf. Petroleum Systems of South East Asia and Australasia, Jakarta, Indonesian Petroleum Association (IPA), p. 115-125.
(Most SE Asia basins similar geological history of Early Tertiary graben formation, fill and transgression, followed by E-M Miocene marine transgression and Late Tertiary regressive deltaic progradation. Main source rocks: (1) Early synrift lacustrine (Oligocene- E Miocene), oil prone; (2) Late synrift transgressive deltaic (Oligocene- E Miocene), oil and gas prone; (3) Early postrift marine (E-M Miocene transgression), mainly gas prone; and (4) Late postrift regressive deltaic (M Miocene-Pliocene), oil and gas prone. Lacustrine shales, fluvio-deltaic coals/coaly shales and organic-rich marine shales generated light waxy oils and abundant gas of region. Proximal basins and environments more oil prone, more distal basins and environments more gas potential; intermediate basins and environments both oil and gas prone)

Doust, H. & R.A. Noble (2008)- Petroleum systems of Indonesia. Marine and Petroleum Geology 25, 2, p. 103-129.
(online at: https://www.academia.edu/es/27950629/Petroleum_systems_of_Indonesia)
(Four Petroleum System Types (PSTs) corresponding to main stages of geodynamic basin development (1) oil-prone Early Synrift Lacustrine in Eocene-Oligocene deeper parts of synrift grabens, (2) oil and gas-prone Late Synrift Transgressive Deltaic in shallower Oligocene- E Miocene portions of synrift grabens, (3) gas-prone Early Postrift Marine of E Miocene transgressive period, and (4) oil and gas-prone Late Postrift Regressive Deltaic of shallowest late Tertiary basin fills. Mixing of predominantly lacustrine to terrestrial charge has taken place. Grouped basins according to dominant PSTs and identified 'basin families', termed proximal, intermediate, distal, Borneo and E Indonesian, according to paleogeographic relationship to Sunda craton)

Doust, H. & H.S. Sumner (2007)- Petroleum systems in rift basins- a collective approach in Southeast Asian basins. Petroleum Geoscience 13, p. 127-144.
(Shell view of SE Asia Tertiary basins. Four types of petroleum systems, correlating with basin evolution stages (early and late synrift, early and late postrift). Petroleum system types characteristic environmentally-controlled source, reservoir and seal lithofacies which, in combination with structural trap style, determine hydrocarbon habitat. Variations in tectonostratigraphic evolution due to differences in paleogeographical position and proximity to late Tertiary collisions. This is reflected in volumes, field sizes and oil- gas ratios)

Dowling, L.M., C.J. Boreham, J.M. Hope, A.P. Murray & R.E. Summons (1995)- Carbon isotopic composition of hydrocarbons in ocean-transported bitumens from the coastline of Australia. Organic Geochemistry 23, 8, p. 729-737.
(Bitumens stranding along coastlines of Northern Territory, W Australia, S Australia, Victoria and Tasmania with biomarker signatures similar to SE Asian oils. Comparison with C Sumatra Minas and Duri lacustrine oils shows very similar isotopic patterns to waxy bitumens from Australian coastline. Asphaltic bitumens from S Australian coastline lighter carbon isotopes)

Escher, B.G. (1920)- The composition of the crude-oils of the Netherlands East Indian Archipelago in connection with the oil bearing strata. In: Algemeen Ingenieurs Congres (General Engineering Congress), Batavia 1920, Sectie 5, Mijnbouw en Geologie, Intro. Paper 1, p. 1-33.
(On composition of crude oils from BPM fields in N and S Sumatra (oils with asphalt base, rich in benzine), E Kalimantan (medium oils with paraffin or with asphalt base with common aromatic and unsaturated hydrocarbons), Tarakan (heavy oils with asphalt base) and Java (oils with paraffin and asphalt base))

Imbus, S.W., B.J. Katz & T. Urwongse (1998)- Predicting CO_2 occurrence on a regional scale: Southeast Asia example. Organic Geochemistry 29, p. 325-345.
(In SE Asia gas fields CO_2 may vary from <10% to 90% in same basin. Multiple possible origins for CO_2, incl. from mantle, carbonate metamorphism, maturation of organic material, etc.). Tectonic setting, basement fault density, reservoir temperature and reservoir pressure are key elements controlling CO_2 abundance)

Jyalita, J., D.H. Amijaya & F. Anggara (2023)- Preliminary geochemical appraisal on Sumatera, Java, and Kalimantan coaly source rocks. J. Applied Geology (UGM) 8, 2, p. 66-75
(online at: https://jurnal.ugm.ac.id/jag/article/view/72588/38851)
(Geochemical analyses of 25 coal and coaly shale samples from outcrops and wells in C Sumatra (Petani Fm), S Sumatra (Talang Akar, Muara Enim Fms), S Central Java (Nanggulan, Eocene), Barito (Warukin Fm, M Miocene) and Kutai (Balikpapan Fm; M Miocene) Basins. Many with good hydrocarbon potential but most are immature)

Kang An & Yang Lei (2010)- Lacustrine source rock occurrence and its petroleum reservoir distribution of Paleogene fault basins in offshore China and Southeast Asia. Xinjiang Petroleum Geol. 2010, 4, p.
(Hydrocarbons generated from lacustrine source rocks in Paleogene rift basins of offshore China and SE Asia account for 95% and 48% of total petroleum resources in these areas. Two models of source rock distribution (1) Bohai Bay basin model with widely distributed, thick, deep lacustrine shale; (2) Asri- C Sumatra basin model with rel. thin, shallow lacustrine shale of limited distribution)

Katz, B.J. (1991)- Controls on lacustrine source rock development for Indonesia. Proc. 20th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, p. 587-619.
(Lacustrine source rocks >80% of Indonesia's known petroleum reserves. Nonmarine source systems not universally distributed. Factors favoring lacustrine source development: tectonic development of narrow basins, subsidence rates in excess of sedimentation rates, rainfall rates in excess of evaporation but insufficient to support growth of rain forests, lack of winter storms, and limited seasonality of surface temperatures)

Katz, B.J. (1995)- Biogenic gas- its formation and economic significance. Proc. 24th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 461-474.
(Significant proportion of global gas reserve-base not thermogenic but of bacterial origin. Several Indonesian basins, with high sedimentation rates, locally high TOC and rel. low T gradients, may be suitable for biogenic gas generation)

Katz, B.J. (1995)- A survey of rift basin source rocks. In: J.J. Lambiase (ed.) Hydrocarbon habitat of rift basins, Geological Society, London, Special Publ. 80, p. 213-240.
(Rift basins contain disproportionate amount of petroleum relative to their area and sediment volume, but not all rifts contain organic-rich deposits, nor are all organic-rich deposits volumetrically significant. Includes examples from C Sumatra, etc.)

Katz, B.J. (2001)- Gas geochemistry- a key to understanding formation and alteration processes. Proc. 28th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 789-802.
(Multiple gas formation mechanisms, reflected in bulk and isotope geochemistry; can be used to decipher gas accumulation history)

Katz, B.J. & B. Mertani (1989)- Central Sumatra- a geochemical paradox. Proc. 18th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, p. 403-425.

(Crude oil data suggest four crude oil families in C Sumatra. Source rock data indicated only one effective oil source, Pematang Brown Shale. Facies variations in Brown Shale may explain differences in crude oils)

Katz, B.J., R.A. Royle & B. Mertani (1990)- Southeast Asian and Southwest Pacific coals contribution to the petroleum resource base. Proc. 19th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 299-329.
(Considerable variation in ability of coals to generate hydrocarbons. With exception may be of algal-dominated coals, coals generally do not contribute to petroleum resource base. Lacustrine source rocks account for 90% of petroleum resource base of Indonesia, 95% of China's)

Kelley, P.A., K.K. Bissada, B.H. Burda, L.W. Elrod & R.N. Pheifer (1985)- Petroleum generation potential of coals and organic rich deposits: significance in Tertiary coal rich basins. Proc. 14th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 2, p. 3-21.
(Contribution of coal to accumulated hydrocarbons controversial. Only alginite produces molecular fingerprint that resembles crude oil, hydrocarbons generated by vitrinite do not. Vitrinite generates minor quantities of hydrocarbons and is not viable oil source. Algae and bacteria probably represent basis for all crude oils)

Kewley, J. (1921)- The crude oils of Borneo. Petroleum Times, London, 5, p. 337-339.
(also in J. Inst. Petroleum Technologists 7, 37, p. 209-233)
((Plummer 1921 AAPG review): In Kutei region in E Borneo Miocene Pliocene deltaic deposits overlie glauconitic marls, limestones and marls of E Miocene and Eocene age. Oil originated in lower Miocene and Eocene marls and limestones and migrated upward, saturating delta deposits. Oil accumulated along Sanga Sanga fold (Sanga Sanga and Sambodja oil fields). Deeper oil rich in paraffin wax; oils from higher levels in or above coal beds poorer in paraffin and richer in aromatic and asphaltic constituents. In Miri field where coal is absent, oil also low in aromatic and asphaltic content. At Perlak in Sumatra, where coal is also absent, oils lower in aromatic and asphaltic constituents than oils of Moera Enim, Sumatra, where coal seams present)

Longley, I. (2005)- Topical tropical non-marine deep water deltaic charge systems in SE Asia. a model to explain why some are oily and some are not. Proc. 30th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 625-646.
(General Asia hydrocarbon source discussion, mainly dealing with Borneo Baram and Mahakam deltas)

MacGregor, D.S. (1994)- Coal-bearing strata as source rocks- a global overview. In: A.C.Scott & A.J. Fleet (eds.) Coal and coal-bearing strata as oil-prone source rocks? Geological Society, London Special Publ. 77, p. 107-116.
(Coal-bearing sequences are significant oil generators only in very specific and relatively uncommon settings. Coals primary or important secondary source facies in Australasia/ SE Asia. In other regions of world no evidence they expelled major oil, but sourced significant amounts of gas. Liquid hydrocarbons restricted to two 'fairways'. (1) Tertiary angiosperm assemblages within 20° of Paleo-Equator and (2) Late Jurassic-Eocene gymnosperm assemblages formed on Australian and associated plates)

MacGregor, D.S. (1995)- The exploration significance of surface oil seepage: an Indonesian perspective. Proc. 24th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 97-109.
(Majority of Indonesian oil provinces with belt of seeps on basin edge. Relationship between seeps and reserves good on basin scale, but poor at sub-basin and field scale. Seeps in W Indonesia controlled by extent of Plio-Pleistocene structural inversion over oil-bearing portions of backarc basins. Less disturbed extensional fabric of C. Sumatra less seepage than inverted fabric of N and S Sumatran basins, despite higher oil reserves. Active seeps frequent over active reverse faults and eroded steep anticlinal crests. High success rate of wells near seeps, but most seeping fields shallow and small. In inverted areas, oil generation usually no longer active and surface oil shows represent destruction of oil pools. Larger fields generally basinward of seep belt)

MacGregor, D.S. (2018)- Physics and biology of biogenic gas plays: implications for SE Asia In: PEGSB SEAPEX Asia Pacific E&P Conference, London, p. 1-26. *(Abstract + Presentation)*
(Surge in biogenic gas discoveries worldwide, particularly in deepwater settings. In SE Asia represented by Rakhine Basin, Myanmar. Also Terang-Sirasun (NE Java - Madura Straits), Niengo (N West Papua), Pandora (Gulf of Papua), etc. Biogenic gas generation shut off at ~60-70° C.,)

Mann, A.L., N.S. Goodwin & S. Lowe (1987)- Geochemical characteristics of lacustrine source rocks: a combined palynologial/ molecular study of a Tertiary sequence from offshore China. Proc. 16th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, p. 241-258.
(Study of Eocene-Miocene lacustrine source rocks from undisclosed well offshore China)

Marty, D.G. & J.E. Garcin (1987)- Presence de bacteries methanogenes methylotrophes dans les sediments profonds du detroit de Makassar (Indonesie). Oceanologica Acta 10, 2, p. 249-253.

(online at: http://archimer.ifremer.fr/doc/00109/22074/19716.pdf)
('Occurrence of methylotrophic methane-producing bacteria in deep-sea sediments from Makassar Strait (Indonesia)'. Competition between sulfate reducing and methane producing bacteria one of main factors controlling biogenic methane genesis in anoxic marine sediments. Methylotrophic methanogenic bacteria found in shallow marine sediments, and methanogenic bacteria able to produce methane from methylamines in sediments from oceanic trench at depth of 2000m in Makassar Strait)

McKirdy, D.M. & A. Horvath (1976)- Geochemistry and significance of coastal bitumen from southern and northern Australia, Australian Petroleum Exploration Assoc. (APEA) Journal 16, p. 123-136.
(Bitumen strandings in Northern Territory of Australia are paraffinic oils, probably from natural submarine oil seeps in Money Shoal Basin. Probably derived from Cretaceous or younger non-marine or deltaic source rocks (see also Summons et al. 1993))

Michels, R., N. Enjelvin-Raoult, E. Marcel, L. Mansuy, P. Faure & J.L. Oudin (2002)- Understanding of reservoir gas compositions in a natural case using stepwise semi-open artificial maturation. Marine and Petroleum Geology 19, 5, p. 589-599.
(Two types of variations with depth of d13C values of gases observed in multilayered gas fields in SE Asia (E Kalimantan?). In normally pressured zones steady increase of d13C values of methane with depth; in overpressured zones first decrease with depth, then regular trend. Experiments on pyrolysis of Mahakam Delta coal show closed pyrolysis carbon isotope trends very similar to high pressured reservoirs; normal pressured reservoirs follow values of semi-open pyrolysis. Gas distributions and d13C isotope composition may be explained in terms of degree of opening of system: high P reservoirs fairly closed systems, with in situ gas generation, normally pressured zones more open and subject to lateral migration)

Munir, N., S. Sanusi, S. Gunawan, T. Nugroho & M. Dwiantoro (2015)- Early screening tools to determine the hydrocarbon potential from unconventional coals and shales source rocks: organic petrology and geochemistry. Proc. Joint Convention HAGI-IAGI-IAFMI-IATMI, Balikpapan, JCB2015-096, p. 1-12.
(online at: https://www.iagi.or.id/web/digital/3/2015_IAGI_Balikpapan_Early-Screening-Tools.pdf)
(Organic petrology and geochemistry of lignite from Muara Enim Fm (S Sumatra), shales from Sangkarewang Fm (Ombilin Basin) and Brown Shale Fm (C Sumatra). All potential for unconventional oil and gas)

Murray, A.P., I.B. Sosrowidjojo, R. Alexander, R.I. Kagi, C.M. Norgate & R.E. Summons (1997)- Oleananes in oils and sediments: evidence of marine influence during early diagenesis? Geochimica Cosmochimica Acta 61, 6, p. 1261-1276.
(Oleananes biomarker derived from angiosperm plants. Abundance of oleananes in terrigenous oils and sediments may be sensitive to changes in early diagenetic conditions and need to be used with caution as age and source markers in fluvio-deltaic and lacustrine petroleum systems. Oleananes absent from base of Eocene coal seam affected by postdepositional seawater intrusion. In deltaic sediments from S Sumatra Basin, oleanane/hopane ratio is strongly correlated with indicators of marine influence. Angiosperm-derived Miocene coal from Philippines, deposited under freshwater conditions, abundant aromatic oleanoids but no oleananes)

Murray, A.P., I.B. Sosrowidjojo, R. Alexander & R.E. Summons (1997)- Locating effective source rocks in deltaic petroleum systems; making better use of land-plant biomarkers. In: J.V.C. Howes & R.A. Noble (eds.) Proc. International Conference Petroleum Systems of SE Asia and Australasia, Jakarta 1997, Indonesian Petroleum Association (IPA), p. 939-945.
(Distribution of oleananes and bicadinanes, land plant biomarkers in many SE Asian oils, can be used to better define maturity and depositional environment of effective source rocks)

Murray, A.P., R.E. Summons, C.J. Boreham & L.M. Dowling (1994)- Biomarker and n-alkane isotope profiles for Tertiary oils: relationship to depositional setting. Organic Geochemistry 22, p. 521-542.
(Biomarker and n-alkane isotope profiles for Late Cretaceous/Tertiary oils from SE Asia, China, PNG, etc., interpreted with respect to six kinds of source rock depositional settings: fluvio-deltaic (S Sumatra, NW Java, NE Kalimantan, etc.), freshwater transitional, lacustrine (C Sumatra), saline lacustrine, marine deltaic and marine carbonate. Oleanane/hopane ratio may overestimate higher plant contribution to marine oils)

Murtrijito, N.A., F.M. Naibaho & W. Ashuri. (2014)- Shale gas: geological perspective of Baong Formation for future chances of North Sumatra Basin; compared to Fort Worth Basin in USA. Majalah Geologi Indonesia (IAGI) 28, 1, p. 41-49.
(online at: www.bgl.esdm.go.id/publication/index.php/dir/article_detail/719)
(Interbedded black shale and limestone of M Miocene Baong Fm in N Sumatra Basin similarities with Barnett Shale of Fort Worth Basin, therefore Baong Fm may also become commercial gas resource)

Noble, R., D. Orange, J. Decker, P. Teas & P. Baillie (2009)- Oil and gas seeps in deep marine sea floor cores as indicators of active petroleum systems in Indonesia. Proc. 33rd Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA09-G-044, p. 385-394.
(Results of geochem analysis of deep sea floor samples from ten 'Black Gold- TGS' areas in Indonesia, suggesting presence of mainly marine-origin Mesozoic and Tertiary source rocks)

Nytoft, H.P., G. Kildahl-Andersen & O.J. Samuel (2010)- Rearranged oleananes: structural identification and distribution in a worldwide set of Late Cretaceous/Tertiary oils. Organic Geochemistry 41, p. 1104-1118.
(Angiosperm biomarkers include oleanane isomers 18a(H) and 18b(H) oleanane, also C30 angiosperm markers lupane and taraxastanes. Rearranged oleananes probably formed by dehydration and rearrangement of higher plant triterpenoids; present in all 25 oleanane-containing oils used. Include analyses from Kutei Basin and Lufa seep, PNG)

Robertson Utama (2000)- Eastern Indonesia and northern Papuan New Guinea- a review of Tertiary oil occurrences. Mult-client study, p. 1-9 + figs., tables *(Unpublished)*
(Geochemical study of Tertiary-sourced oils and oil stains from Salawati Basin, Bintuni Basin, E Sulawesi Basin and oil seeps from PNG N New Guinea Basin. Presence of angiosperm-derived biomarkers (oleanane) used to distinguish Tertiary-sourced oils, but oil stains lacking oleanane from S Salawati Basin included, due to similarity to main group of Salawati oils. All oils similar and derived from mixture of marine-derived organic matter and terrigenous debris, deposited in marine facies, and deeper marine time-equivalents of carbonate reservoir horizons or slightly younger, more open marine horizons)

Robertson Research (Singapore) Pte Ltd. (1983)- Petroleum geochemistry of Indonesian basins. Unpublished multi-client study, 5 vols.

Robinson, K.M. (1987)- An overview of source rocks and oils in Indonesia. Proc. 16th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 97-122.
(Indonesia source rocks lacustrine, fluvio-deltaic and marine. Lacustrine source most productive (most oil in C Sumatra, some Sunda Basin, possibly oil in W Natuna). Fluvial-deltaic source rocks sourced oil in majority of foreland/back-arc basins of W Indonesia. Marine source rocks in E Indonesia (Salawati, E Sulawesi). Pre-Tertiary (Permian/Jurassic) oil source in Bintuni and Bula (Seram) and possible source in E Sulawesi and Banggai-Sula. Lacustrine oils low-medium gravity, waxy, low sulfur and often high C30 4-methyl steranes. Marine oils low-medium gravity, low wax, medium-high sulfur oils and high C27-C29 diasteranes and steranes. Fluvio-deltaic oils from higher plants medium-high gravity, waxy, low sulfur and abundant C30 alkanes)

Saller, A., R. Lin & J. Dunham (2006)- Leaves in turbidite sands; the main source of oil and gas in the deep-water Kutei Basin, Indonesia. American Assoc. Petroleum Geol. (AAPG) Bull. 90, 10, p. 1585-1608.
(Gas-oil- condensate in Upper Miocene in deep-water Kutei Basin, off E Kalimantan, derivated from land-plant source material. Best source rocks are deep-water sandstones with coaly fragments, pieces of wood, resinite, and other coaly debris. Laminar coaly fragments are dominant, and were leaf fragments, carried into deep water by turbidity currents during lowstands of sea level. Kutei Basin deep-water shales contain mainly silt-size vitrinite grains with poor generative qualities. Liquids from leaves high wax contents)

Satyana, A.H. (2016)- The power of oil biomarkers for regional tectonic studies: how the molecular fossils imply exploration ventures- cases from Indonesia. Proc. 40th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA16-582-G, p. 1-28.
(Three case studies of use of biomarkers in identifying source rock depositional environments: (1) Paleogene rift basins of Sumatra, with different biomarkers for early rift lacustrine facies, late rift fluviodeltaic and marine facies; (2) Eocene of Makassar Straits and W Sulawesi (with Eocene waxy lacustrine oil in Kaluku 1), and (3) Salawati Basin, with Tertiary anoxic marine, possibly lagoonal source rocks)

Satyana, A.H. (2017)- Regional petroleum geochemistry of Indonesian basins: updated, and implications for future exploration. Proc. 41st Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA17-555-G, p. 1-32.
(Comprehensive review of petroleum geochemistry of Indonesian basins. Oils of W Indonesian basins three broad families: (1) lacustrine (C Sumatra, Sunda-Asri, partly W Natuna, and W Sulawesi offshore/N Makassar Straits); (2) fluvio-deltaic (S Sumatra, W Java, E Java, Barito, Kutai, Tarakan), and (3) marginal-shallow marine (N Sumatra. W Sulawesi onshore). Most oils from E Indonesia basins marginal-shallow marine; sourced from Neogene (Salawati, Banggai), Jurassic (Bintuni), Triassic-Jurassic (Timor, Buton, Seram, Timor). Both thermogenic and biogenic gases)

Satyana, A.H. (2017)- Future petroleum play types of Indonesia: regional overview. Proc. 41st Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA17-554-G, p. 1-33.
(Review of 8 future hydrocarbon play types (proven and unproven) in Indonesia: (1) Paleogene synrift and pre-Tertiary Basement (Sumatra-Java-Natuna-Barito); (2) Neogene delta and deepwater of E Kalimantan-Makassar Straits, (3) Paleogene synrift and postrift of W Sulawesi offshore-Bone-Gorontalo; (4) Gondwanan Mesozoic sections of Sumatra-Java-Makassar Straits; (5) Paleogene-Neogene sub- and intra-volcanic of Java-W Sulawesi,

(6) collided Mesozoic Australian passive margin sediments (Gorontalo-Buton-Banggai-Sula-Outer Banda Arc-Lengguru-Central Ranges of Papua); (7) Paleozoic of Arafura Sea- S Papua; (8) Neogene Pacific province of North Papua)

Satyana, A.H. (2025)- Natural hydrogen systems in various geotectonic settings of Indonesia bottom-up approach.Proc. 49th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA25-IS-387, p. 1-23.
(Natural hydrogen (H_2) may be generated from ultramafic rocks, from oxidation of iron-rich minerals. So far, only one example:in Indonesia of hydrogen gas seeps: Tanjung Api, Ampana, C Sulawesi (e.g. Van Gorsel & Subroto (2022); not referenced here, although it triggered this new round of research). Other geotectonic settings may have potential for generation of hydrogen)

Satyana, A.H., L.P. Marpaung, M.E.M. Purwaningsih & M.K. Utama (2007)- Regional gas geochemistry of Indonesia: genetic characterization and habitat of natural gases. Proc. 31st Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA07-G-050, p. 1-31.
(Geochemistry of natural gases in Indonesian basins, using 350 gas occurrences. Both thermogenic and biogenic (bacterial) gas types recognized. Thermogenic gases generally <95% methane and heavier C isotope ratios (>-45‰). Biogenic gases >98% methane and lighter C isotope ratios (<-60‰). Thermogenic gases dominate in Indonesia. Biogenic gases mainly in W Sumatra fore-arc basins, E Java Basin and foredeep of Sorong Fault Zone, NW Papua. High CO_2 mainly inorganic origin (thermal destruction of carbonates or volcanic degassing). H2S in some gas fields due to thermo-chemical sulfate reduction of deep, hot carbonates)

Satyana, A.H. & M.E.M. Purwaningsih (2013)- Variability of Paleogene source facies of circum- and drifted Sundaland Basins, Western Indonesia: constraints from oil biomarkers and Carbon-13 isotopes. AAPG Int. Conv. Exhib., Singapore 2012, Search and Discovery Article 10474, p. 1-36. *(Abstract + Presentation)*
(online at: www.searchanddiscovery.com/documents/2013/10474satyana/ndx_satyana.pdf)
(Tertiary basins around Sundaland of W Indonesia and its drifted parts (S Makassar Strait, W & S Sulawesi, and Bone Basins) initially formed in Mid- Late Eocene. Thick Paleogene sediments in rift and early post-rift phases of basins contain important hydrocarbon source rocks. Biomarkers and carbon isotopes of oils allow identification of Paleogene lacustrine, fluvio-deltaic and marine source facies)

Satyana, A.H. & M.E.M. Purwaningsih (2013)- Variability of Paleogene source facies of Circum-Sundaland basins, Western Indonesia: tectonic, sedimentary and geochemical constraints- implications for oil characteristic. Proc. 37th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA13-G-162, p. 1-23.
(Similar to paper above. Paleogene source rocks in Sundaland basins include lacustrine facies (most significant; C Sumatra, Sunda-Asri, S Sumatra, W Natuna) to carbonaceous shales and coals of fluvio-deltaic and paralic facies (S Sumatra, W Java, E Java, Barito, W Sulawesi) and marine facies (N Sumatra))

Schiefelbein, C.F., J.E. Zumberge & S.W. Brown (1997)- Petroleum systems in the Far East. In: J.V.C. Howes & R.A. Noble (eds.) Proc. Internatonal Conference Petroleum Systems of SE Asia and Australasia, Jakarta 1997, Indonesian Petroleum Association (IPA), p. 101-113.
(~350 crude oils analyses used to identify different petroleum systems in Far East. Oils separated into three groups: terrigenous, lacustrine, and marine. More specific geochemical criteria allowed establishment of sub-groups of oils according to specific source environment)

Schiefelbein, C. & N. Cameron (1997)- Sumatra/Java oil families. In: A.J. Fraser, S.J. Matthews & R.W. Murphy (eds.) Petroleum Geology of Southeast Asia. Geological Society, London, Special Publ. 126, p. 143-146.
(122 oils analyzed. Majority of oils either 'lacustrine' or 'terrigenous' Tertiary source. Two oils from N Sumatra marine signature. Several oils from C and S Sumatra mixed characteristics)

Schumacher, D. & L. Clavareau (2015)- Geochemical exploration strategies for Southeast Asia. Proc. Asia Petroleum Geoscience Conference and Exhibition (APGCE), Kuala Lumpur, 25954, 2015, p. 1-5.
(Brief review of hydrocarbon microseepage surveys. Microseepage predominantly vertical, so surface anomalies may approximate size and shape of hydrocarbon accumulation. Little detail)

Shanmugam, G. (2008)- Leaves in turbidite sands: The main source of oil and gas in the deep-water Kutei Basin, Indonesia: Discussion. American Assoc. Petroleum Geol. (AAPG) Bull. 92, 1, p. 127-137.
(online at: https://www.researchgate.net/publication/249898004_Leaves_in_turbidite_sands_The_main_source_of_oil_and_gas_in_the_deep-water_Kutei_Basin_Indonesia_Discussion)
(Critical discussion of Saller et al. (2006) leaves in turbidite sands as oil source (GS basically agrees, but follows with discussion of seemingly unrelated lowstand vs highstand and turbidite models, tsunamis, etc.; JTvG)

Sosrowidjojo, I.B., A.P. Murray, R. Alexander, R.I. Kagi & R.E. Summons (1996)- Bicadinanes and related compounds as maturity indicators for oils and sediments. Organic Geochemistry 24, p. 43-55.
(Maturity of oils and sediments derived from catagenetic products of plant material. Polycadinene indices tested for Tertiary oils from S Sumatra, PNG, New Zealand and Australia. Bicadinane maturity indicator continues to change into oil window and may be useful in ranking relative maturity of oils)

Stout, S.A. (1995)- Resin-derived hydrocarbons in fresh and fossil dammar resins and Miocene rocks and oils in the Mahakam Delta, Indonesia. In: K.B. Anderson & J.C. Crelling (eds.) Amber, resinite, and fossil resins, Chapter 3, American Chemical Society, Washington, Symposium Series 617, p. 43-75.
(Hydrocarbons derived from fresh dammar resin are compared to those in Miocene fossil resins and Miocene-sourced oils in Mahakam Delta. Dammar resins undergo few chemical changes during early diagenesis. Bicadinanes are absent in immature resins, but form upon heating in lab or subsurface)

Subono, S. (1996)- Hydrocarbon generation and multiprocess thermal model in oil basins of Indonesia. In: S.Y. Kim et al. (eds.) Proc. 32nd Annual Session CCOP, Tsukuba 1995, p. 53-68.

Subroto, E.A. (1990)- 30-NOR-17 [alpha] (H) - hopanes and their applications in petroleum geochemistry. Ph.D. Thesis Curtin University, Perth, p. 1-186.
(online at: http://espace.library.curtin.edu.au)
(22 oils and sediments analysed for biological marker compounds. Compounds typical of carbonate-rich source rocks identified. Sediments and oils from N Sumatra Basin contain very different biomarkers)

Subroto, E.A. (1990)- 30-Norhopane, biomarker baru penunjuk lingkungan karbonat: suatu studi geokimia petroleum terhadap sampel batuan dan minyak mentah. Proc. 19th Annual Conv. Indonesian Association Geologists (IAGI), Bandung, 1, p. 230-241.
('30-Norhopane, a new biomarker as carbonate environment indicator: a study of petroleum geochemistry of rock and crude samples'. Study of rocks and oil samples from Seram and other countries identify C30 biomarker as typical of carbonate hydrocarbon source rocks)

Subroto, E.A., B.Y. Afriatno & P. Sumintadireja (2007)- Prediction of the biogenic gas occurrences in Indonesia based on studies in East Java and Tomori (Central Sulawesi). Jurnal Teknologi Mineral 14, 2, p. 115-124.
(online at: www.fttm.itb.ac.id/galeri/prediction.pdf)
(Some Indonesian gas fields with biogenic gas, characterized by dryness (>99% methane) and light carbon-isotopes (-61 to -67‰). One field producing biogenic gas in E Java Basin, probably derived from Plio-Pleistocene. Similar situation in Tomori, Sulawesi. Plio-Pleistocene sediments in Indonesia generally high sedimentation rates, low thermal gradients and high organic content, thus potential source for biogenic gas)

Subroto, E.A., R. Alexander & R.I. Kagi (1991)- 30-Norhopanes: their occurrence in sediments and crude oils. Chemical Geology 93, 179-192.
(Ratios of hopanes types geochemical biomarker in oils and sediments reflect sample maturity, with higher norhopanes in more mature samples. Incl. examples from Triassic oils from Seram and Buton asphalt)

Subroto, E.A., R. Alexander, U. Pranjoto & R.I. Kagi (1992)- The use of 30-Norhopane series, a novel carbonate biomarker, in source rock to crude oil correlation in the North Sumatra Basin, Indonesia. Proc. 21st Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 145-163.
(30-norhopanes as carbonate biomarker proposed recently. Three types of source rocks in N Sumatra Basin: shale, carbonaceous shale and calcareous shale. n-Alkanes and steranes can only be used to distinguish two

source types since shale and calcareous shale show similar characteristics. Recognition of three source types can only be observed using the hopane distribution. One crude oil can be correlated to calcareous shale and two crude oils are correlative to shale source rock. Crude oil of coaly shale type is not found during this study)

Subroto, E.A., A. Bachtiar, B. Priadi, R.P. Koesoemadinata & D. Noeradi (1998)- Could oleanoids, substances found abundantly in coaly sediments, be used as geochemical maturity indicator? A case study in the Kutai Basin. Proc. 27th Annual Conv. Indonesian Association Geologists (IAGI), Yogyakarta, 1, p. 129-139.
(Oleanoid ratio OR1 correlates with vitrinite reflectance, and may be maturity indicator)

Subroto, E.A., D. Noeradi & B.Y. Afriatno (2009)- Geochemical identification of favorable basins for biogenic gas exploration in Indonesia. Proc. 33rd Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA09-G-185, p. 405-415.
(Biogenic gas formed at T <75°C is dry (>95% methane) and isotopically light (<-55‰). May contribute >20% of global gas resources. Biogenic gas large component of gas produced from E Java. Other favorable sites for biogenic gas are basins with young sediments (Plio-Pleistocene), high sedimentation rates (>50 m/My) and low Temp (0-75°C))

Sudarmono, T. Suherman & B. Eza (1997)- Paleogene basin development in Sundaland and its role to the petroleum systems in Western Indonesia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. International Conference Petroleum Systems of SE Asia and Australasia, Jakarta, Indonesian Petroleum Association (IPA), p. 545-560.
(ARCO paper with Eo- Oligocene paleogeography maps based on Daly (1987) reconstructions. Syn-rift continental deposits followed by late rift marine incursion and fully marine facies during post-rift. Paleogene basins commonly complete petroleum systems with source, reservoirs and seals. Maturity only after Neogene deposition. Lacustrine source rocks during rifting; marine carbonaceous shales and coals during late rift to post-rift. Productive reservoirs mostly upper syn-rift or post-rift. E Java- E Kalimantan- W Sulawesi rifts older (Late Paleocene- E Eocene) than Sumatra- W Java- W Kalimantan systems (Late Eocene- E Oligocene)

Sujanto, F.X. (1997)- Substantial contribution of petroleum systems to increase exploration success in Indonesia. In: J.V.C. Howes & R.A. Noble (eds.) Proc. International Conference Petroleum Systems of SE Asia and Australasia, Jakarta, Indonesian Petroleum Association (IPA), p. 1-14.

(Review of hydrocarbon occurrences in Pretertiary 'basement' in Sumatra (granitoids and metamorphics in NE Beruk, Suban, Sei Teras), Kalimantan (Tanjung granitoid, volcanics, metamorphics) and Seram (Oseil Mesozoic limestone))

Suwarna, N., H. Panggabean, M.H. Hermiyanto & A.K. Permana (2007)- Characterization of unconventional fossil fuels of selected areas, in Sumatera and Kalimantan, using organic petrography and geochemistry. Proc. 31st Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA07-G-079, p. 1-15.
(Oil shale and coalbed methane studies in Sumatra and Borneo)

Sykes, R. & I. Cibaj (2010)- Peat biomass and early diagenetic controls on oil generation from Mahakam Delta coals, Kutei Basin: preliminary study of coals from the Jalan Baru section near Samarinda. Proc. 34th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, IPA10-G-105, p. 1-17.

(Geochem study of 11 outcrop coal samples from M Miocene Balikpapan Group near Samarinda. Analysed coals have potential to expel oils ranging from borderline gas condensate to high-wax, paraffinic- naphthenic-aromatic oil. Non-volatile, paraffinic oil potential of Mahakam Delta coals controlled primarily by abundance of leaf- and cork-derived macerals. These macerals expected to be more abundant in thin, planar mire coals and coaly mudstones than in thicker, raised mire coals owing to better preservation potential of surface leaf biomass under higher groundwater levels in planar mires)

Tahir, N.T., H.M. Abd. Rahim, Tay Joo Hui, Tan Hock Seng, M.F. Fadzil & M.R. Abas (2009)- Distribution and sources of hydrocarbons in lagoon sediments of Setiu Wetland, Terengganu, Malaysia. Aquatic Ecosystem Health and Management 12, 4, p. 344-349.
(Hydrocarbon compounds in surface sediment of Setiu Wetland analysed and characterized using GCMS. Terrestrial plants input (epicuticular plant waxes) are dominant contributor of organic compounds in the sediments with a minor input from marine phytoplankton (algae) as well as bacteria)

Takada, M., S. Shimada & H. Takahashi (2016)- Tropical peat formation. In: M. Osaki & N. Tsuji (eds.) Tropical Peatland Ecosystems, Springer, p. 127-135.
(Classification/ characterization of peatlands in SE Asia, mainlyin Kalimantan. Ombrotrophic and eutrophic peatlands, or topogenous and ombrogenous peatlands developed by accumulation of plant debris in coastal and sub-coastal areas, inland areas and high altitude areas. Along coastline, youngest peat formation started at 3500-6000 yr BP in response to rising sea levels at end of ast glacial period. Peat in inland peatland areas formed from ~20,000 yr BP. In SE Asia peatland common formation of convex-shaped peat dome formed beyond extent of river floodwater and under rain-dependent conditions; known as ombrogenous peat)

Teerman, S.C. & R.J. Hwang (1989)- Evaluation of the source rock potential of Sumatran coals by artificial maturation of coal. Proc. 18th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 469-489.
(Hydrous pyrolysis experiments on Miocene Muara Enim Fm lignite from Bukit Asam, S Sumatra. Lignite is liptinite-rich (32% of total macerals); resinite is the most abundant liptinite maceral (13.7%). Rock Eva1 Hydrogen Index values of 483 mg HC/g OC. Significant amounts of liquid hydrocarbons assimilated by vitrinitic matrix of coal prior to expulsion, making vitrinite-rich coals poor oil source rocks. Only liptinite-rich coals (>15-20% of total macerals) appear capable of generating significant amounts of liquid hydrocarbons but expelled product will probably be low. Most Sumatran coals not liptinite-rich (typically 5-10%))

Teerman, S.C., R.J. Hwang, Y.C. Tang, B. Mertani, M. Stauffer & T.T. Ta (1994)- Geochemical evaluation of the liquid hydrocarbon potential of "marginal source rocks"- application to Indonesian basins. Proc. 23rd Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, p. 457-478.
(Expulsion efficiency is critical factor in potential of marginal source rocks to provide adequate hydrocarbon charge. Expulsion efficiency in marginal source rocks highly variable due to amount of hydrocarbon generation and adsorptive capacity of certain organic matter assemblages. Numerous examples of marginal source rocks in Indonesian region. With case study of Telisa Fm in Sumatra.)

Ten Haven, H.L. & C. Schiefelbein (1995)- The petroleum systems of Indonesia. Proc. 24th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, 1, p. 443-459.
(>200 oil analyses. W Indonesia 2 main petroleum systems: Tertiary lacustrine and Tertiary terrigenous, with additional marine petroleum system in N Sumatra and E Natuna. E Indonesia 3 main systems: Tertiary marine carbonate, Mesozoic marine carbonate and Mesozoic marine siliciclastic)

Thompson, M., C. Remington, J. Purnomo & D. MacGregor (1991)- Detection of liquid hydrocarbon seepage in Indonesian offshore frontier basins using Airborne Laser Fluorosensor (ALF); the results of a Pertamina/ BP joint study. Proc. 20th Annual Conv. Indonesian Petroleum Association (IPA), Jakarta, p. 663-689.
(ALF surveys by BP over offshore Sumatra Forearc, Java Forearc, Billiton Basin, Salayar, Spermonde, S and N Makassar, Bone, Gorontalo and Halmahera Basins. Hydrocarbons seeping from all basins except Java forearc, though further analysis is required. Areas of greatest interest are Billiton, S Bone and S Makassar basins)

Thompson, S., B.S. Cooper & P.C. Barnard (1994)- Some examples and possible explanations for oil generation from coals and coaly sequences. In: A.C. Scott & A.J. Fleet (eds.) Coal and coal-bearing strata as oil-prone source rocks?, Geological Society, London, Special Publ. 77, p. 119-137.
(Coals and associated shales important oil source rocks in some deltaic environments. Formation of hydrogen-rich kerogen either by concentration of plant cuticles and spores after reworking of delta top freshwater peats, or by accumulation of delta margin peats under saline conditions. Examples include Oligo-Miocene Talang Akar Fm of S Sumatra-NW Java (perhydrous vitrinite source of isotopically light waxy oils with biomarkers from tree resins). Waxy oils also produced in Sunda Basin (derived from algal kerogen in older, lacustrine Banuwati Fm shales (low contents of land plant biomarkers and heavier carbon isotopic signature))

Thompson, S., R.J. Morley, P.C. Barnard & B.S. Cooper (1985)- Facies recognition of some Tertiary coals applied to prediction of oil source rock occurrence. Marine and Petroleum Geology 2, 4, p. 288-297.
(Coals are oil source rocks in many Tertiary basins of SE Asia. Precursors of these are coastal plain peats in everwet tropical climate. Distribution, petrography and chemistry of coaly Miocene source rocks present in Kutai Basin described)

Thompson, S., B.S. Cooper, R.J. Morley & P.C. Barnard & (1985)- Oil-generating coals In: B.M. Thomas et al. (eds.) Petroleum Geochemistry in exploration of the Norwegian Shelf, Proc. Norwegian Petroleum Society (NPF) Conference, Stavanger 1984, Graham & Trotman Ltd., London, p. 59-73.
(On hydrogen-rich and oxygen- poor coals as oil source rocks in Tertiary basins of SE Asia. Precursors of these are coastal plain peats, mainly developed in everwet and tropical climate. In these environments water flow and reworking can concentrate liptinitic kerogen in preference to vitrinitic kerogen. Distribution, petrography and chemistry of coaly Miocene source rocks in Kutai Basin described)

Todd, S.P., M.E. Dunn & A.J.G. Barwise (1997)- Characterizing petroleum charge systems in the Tertiary of SE Asia. In: A.J. Fraser, S.J. Matthews & R.W. Murphy (eds.) Petroleum Geology of Southeast Asia, Geological Society, London, Special Publ. 126, p. 25-47.
(Most SE Asian Tertiary petroleum from paralic (higher land plant) source, although larger proportion of oil from lacustrine algal sources. Lacustrine sources mainly in Paleogene syn-rift lakes, paralic coals and coaly mudrocks in Miocene post-rift. Oil-prone source rocks preferentially paralic between lower coastal plain and lower estuary/delta front facies, perhaps involving mangrove system. Younger plays more gas prone. Significance of biogenic gas poorly understood. Vertical migration common; lateral migration restricted to ~20 km or less from kitchen)

Tran Cong Tao (1994)- Maturation of organic matter in Tertiary sediments of the Mekong Basin, offshore South Vietnam. In: J.L. Rau (ed.) Proc. 29th Session Committee Co-ord. Joint Prospecting Mineral Resources in Asian Offshore Areas (CCOP), Hanoi 1992, Bangkok, 2, p. 169-181.

Van Aarssen, B.G.K., H.C. Cox, P. Hoogendoorn & J.W. De Leeuw (1990)- A cadinene biopolymer present in fossil and extant dammar resins as a source for cadinanes and bicadinanes in crude oils from Southeast Asia. Geochimica Cosmochimica Acta 54, p. 3021-3031.
(Chemical composition of fossil resin from Miocene outcrop in Lumapas, Brunei, compared to Recent counterpart dammar from trees of family Dipterocarpaceae, to establish nature of precursor of bicadinanes)

Van Aarssen, B.G.K., J.K.C. Hessels, O.A. Abbink & J.W. de Leeuw (1992)- The occurrence of polycyclic sesqui-, tri-, and oligoterpenoids derived from a resinous polymeric cadinene in crude oils from southeast Asia. Geochimica Cosmochimica Acta 56, 3, p. 1231-1246.
(Structurally related hydrocarbons consisting of one or more sesquiterpane units in saturated and aromatic hydrocarbon fractions of crude oils from SE Asia (Java, Sumatra, Malaysia). Thought to originate from cadinene polymer present in dammar resins from angiosperms like Dipterocarpaceae trees, which depolymerises on thermal stress)

(Peat cores, from margin and center of tropical raised bog from Sebangau River near Palangkaraya. Peats from margin of raised bog more decomposed than center and basal peats more decomposed than peats from upper layers. Basal peats deposited under mesotrophic conditions and more seasonal climate)

Dommain, R., J. Couwenberg & H. Joosten (2011)- Development and carbon sequestration of tropical peat domes in south-east Asia: links to post-glacial sea-level changes and Holocene climate variability. Quaternary Science Reviews 30, p. 999-1010.
(Three peat dome regions distinguished:(1) inland C Kalimantan, (2) Kutai basin and (3) coastal areas across entire SE Asia. With onset of Holocene, first peat domes developed in C Kalimantan as response to rapid post-glacial sea-level rise over Sunda Shelf and intensification of Asian monsoon. Peat accumulation rates in C Kalimantan declined after 8500 BP with lower rate of sea-level rise. Kutai basin peat domes younger than ~8300 BP, driven by accretion rates of Mahakam River. Most coastal peat domes initiated between 7000-4000 BP as consequence of Holocene maximum in regional rainfall and stabilisation and regression of sea-level)

Dommain, R., J. Couwenberg. P.H. Glaser, H. Joosten, I. Nyoman & N. Suryadiputra (2014)- Carbon storage and release in Indonesian peatlands since the last deglaciation. Quaternary Science Reviews 97, p. 1-32.
(Kalimantan and Sumatra largest global concentration of tropical peatlands since 20 ka, mainly driven by sealevel rise. Coastal peatlands formed mainly after 7 ka, when sea-level rise slowed to 2.4 mm/yr. Falling sea levels after 5 ka led to rapid peatland expansion (and carbon storage) in coastal lowlands, doubling total peatland area in W Indonesia. Due to human activities in recent decades, Indonesian peat swamps switched from important carbon sinks to significant carbon sources, contributing to rising atmospheric CO_2 levels)

(Sumatran rain-fed and domed (ombrogenous) mires used as models for thick coal deposits worldwide. Kumpeh and Dendang peatlands between anastomosing Batang Hari and Kumpeh Rivers domed topography despite meander channels and tributaries forming re-entrants into peatlands and flood-plain levee sediments. Resulting peat deposits small area (240-540 km^2), discontinuous, lenticular, <9 m thick. Endapan domed to flat peatland from edge of Batang Hari and Kumpeh Rivers to coast, is blanket-like (4000 km^2) peat deposit, >11m thick. Raised peatlands along rivers reflect buildup of flood sediments that sustained robust vegetation, which in turn, accumulated raised peat (<9 m) that reduced extent of flooding. Flat coastal peatlands (Endapan) reflect peat accumulation (>11m) from stunted vegetation removed from flood-sustaining nutrients)

XII.4. Economic Minerals, Mining

The listing below contains general papers on Economic minerals and Mining in the Indonesian region. papers Numerous additional papers on mineral deposits that are specific to one region or locality are listed under those regions and are not repeated here.

Abendanon, E.C. (1922)- Het voorkomen en de economische beteekenis van mineralen in Ned. Oost-Indie. Economische Berichten, Ministerie van Buitenlandse zaken, p. 1-10.
(online at: https://www.delpher.nl/nl/boeken/view?identifier=MMKB31:037711000:00001)
('The occurrence and economic significance of minerals in the Netherlands East Indies'. With distribution map (part of Inaugural address of Abendanon's inauguration as Professor of Economic Geology at University of Amsterdam in December 1921)

Abidin, H.Z. & A.S. Hakim (2005)- Endapan sulfida masif volkanogenik: ciri dan sebarannya di Indonesia. Publikasi Ilmiah Pendidikan dan Pelatihan Geologi. 1, 1, p. 47-57.
('Volcanogenic Massive Sulphide deposits: characteristics and distribution in Indonesia'. Reprinted in Metalogeni Sundaland I (2014), p. 263-273. Polymetallic Massive Sulfide deposits always associated with volcanics and sediments. VMS deposits in Indonesia two types (1) Kuroko-type Sangkaropi (S Sulawesi, Cu-Pb-Zn), (2) Lerokis and KaliKuning (Wetar), with stratabound Au-Ag bodies of sedimentary exhalative origin)

Adam, J.W.H. (1941)- Een "top-hypothese voor de verklaring van de primaire aanrijkingen in the jonge zilver-goud gangen. De Ingenieur in Nederlandsch-Indie (IV) 8, 8, p. IV.69- IV.74.
(online at: https://www.stichtingblauwelijn.nl/assets/files/1941-08.pdf
('A "top-hypothesis" for the explanation of primary enrichments in the young silver-gold veins'. Experience in the Netherlands Indies suggest gold-silver enrichment in young epithermal deposits is mainly near tops of quartz veins, and may impoverish rapidly from certain depth downnward))

Adam, J.W.H. & W. van Tongeren (1941)- Over het nut van systematische geologische waarnemingen voor den mijnbouw. De Ingenieur in Nederlandsch-Indie (IV) 8, 11, p. IV.96- IV.99.
(online at: https://www.stichtingblauwelijn.nl/assets/files/1941-11.pdf)
('On the utility of geological observations for mining'. Former chief geologist of Billiton Maatschappij J.W.H. Adam argues for the importance of geology in mining exploitation. One example is primary tin mineralization in Klappa Kampit mine in Belitung, which closely follows a radiolarite zone, which aided in mine exploitation))

Agoes, E. (1988)- Uranium exploration in Indonesia: an overview. Proc. Conference Uranium deposits in Asia and the Pacific; geology and exploration, Jakarta 1985, Int. Atomic Energy Agency (IAEA), Vienna, IAEA-TC-543/12, p. 167-178.
(online at: https://inis.iaea.org/records/m2jpy-cpy74)
(BATAN review of radioactive minerals identified in several areas in W (Sumatra, Kalimantan) and E Indonesia (W Sulawesi,Banggai-Sula, W Papua). In W Indonesia generally linked to Mesozoic granites)

Anonymous (1918)- Voorkomen en gebruik van mangaanertsen. Verslagen Mededeelingen Indische delfstoffen en hare toepassingen, Dienst Mijnwezen Nederlandsch Oost-Indie, 5, p. 1-51.
(online at: https://www.delpher.nl/nl/boeken/view?identifier=MMKB24:078917000:00039)
('Occurrences and application of manganese ores'. Review of manganese ore occurrences around world and in Indonesia. Manganese ore occurrences known from Java (mined at Kliripan, Kulun Progo; Also near Tasikmalaya, W Java), SE Kalimantan (Gunung Besi near Pengaron). Also possibly in Sumatra, Timor)

Anonymous (1919)- Phosphaat. Verslagen Mededeelingen Indische delfstoffen en hare toepassingen, Dienst Mijnwezen Nederlandsch Oost-Indie, 6, p. 1-23.
(online at: https://resolver.kb.nl/resolve?urn=MMKB24:078918000:pdf)
('Phosphate'. Brief review of phosphate occurrences in Indonesia. Usually associated with bat guano in caves. No commercially significant deposits. No maps)

Anonymous (1919)- Ijzerertsen in Nederlandsch-Indie. Verslagen Mededeelingen Indische delfstoffen en hare toepassingen, Dienst Mijnwezen Nederlandsch Oost-Indie, 7, p. 1-71.
(online at: https://resolver.kb.nl/resolve?urn=MMKB24:078919000:pdf)
('Iron ores in the Netherlands Indies'. Iron ore widespread in Netherlands Indies, but rarely commercially viable: Tanah Laut (SE Kalimantan), C Sulawesi, Lampung (S Sumatra), etc. Incl. lateritic and detrital iron ores)

Anonymous (1920)- Magnesiet. Verslagen Mededeelingen Indische delfstoffen en hare toepassingen, Dienst Mijnwezen Nederlandsch Oost-Indie, 11, p. 1-18.
(online at: https://resolver.kb.nl/resolve?urn=MMKB24:078903000:pdf)
('Magnesite'. Review of occurences of magnesite (magnesium carbonate) in Indonesia. Associated with weathered serpentinite in E Sulawesi and Leti. No economic deposits known)

Anonymous (1922)- Jodium. Verslagen Mededeelingen Indische delfstoffen en hare toepassingen, Dienst Mijnwezen Nederlandsch Oost-Indie, 14, p. 1-64.
(online at: https://www.delpher.nl/nl/boeken/view?identifier=MMKB24:078906000:00016)
('Iodine'. Review of iodine occurrences in Indonesia, mainly from brine in wells in Tertiary basins of East Java, north of the volcanic arc)

(Uranium deposits in Indonesia mainly in Kalimantan, Sulawesi, Sumatera, Papua, Bangka, Belitung and Riau islands (but no uranium mining anywhere). Uranium exploration activities started in late 1960s. Calculated resources from Kalan area (W Kalimantan), Mamuju area (W Sulawesi) and Sibolga area (N Sumatera). Etc.)

Tamehe, L.S., Y. Zhao, W. Xu & J. Gao (2024)- Ni(Co) laterite deposits of Southeast Asia: a review and perspective. Minerals (MDPI) 14, 2, 10.3390/min14020134, p. 1-22.
(online at: https://www.mdpi.com/2075-163X/14/2/134)
(SE Asia Ni(Co) laterite deposits mainly distributed in Indonesia, the Philippines, and Myanmar. Also potential source of scandium, Rare Earth elements, and platinum group elements. Indonesia has world's largest published Ni ore reserves (21,000,000 tons Ni) and is largest Ni producer with 26% of global Ni production (760,000 tons Ni). Ni(Co) laterite deposits controlled by spatial occurrence of ophiolites. In Indonesia three metallogenic belts (1) SE Kalimantan (e.g., Pulau Sebuku), (2) E Sulawesi (e.g., Sorowako, Kolonodale and Moraweli) and (3) N Maluku (e.g., Weda Bay and W Papua))

(online at: https://www.academia.edu/10141451/Epithermal_gold_deposits_of_the_southwest_Pacific)
(BHP data tabulation for 137 epithermal gold deposits and prospects in Australia (30), Fiji (2), Indonesia (43), New Zealand (22), Palau and Yap (2), Papua New Guinea (18), Philippines (19), and Solomon Islands (1). Epithermal deposits in SW Pacific similar to other regions, but low-sulfidation style deposits formed at deeper levels than typical elsewhere; high-sulfidation deposits more common than along NE Pacific margin. Differences can be partly understood in terms of tectonic setting and evolution of volcanic arcs of SW Pacific)

Whitehouse, J. (2011)- Manganese resource potential Banda arc region, Eastern Indonesia. Stratum Resources Pty Ltd, Non-confidential report, p. 1-31. *(online at: https://www.academia.edu/7399929/Manganese_resource_potential_Banda_Arc_region_eastern_Indonesia*
(Manganese deposits in C and W Timor sporadically mined, while more intensive mining recently began on Flores Island. Manganese deposits of E Indonesia are associated with (1) manganese nodules in deep−sea (pelagic) sediments or (2) stratabound ore deposits in mostly red calcareous shales within limestone−dolomite masses. Manganese-rich sediments, possibly derived from chemical reactions between hot manganese−bearing volcanic rocks ejected into cold sea−water. Deposits subsequently incorporated as structurally disrupted blocks in Bobonaro Melange. Potentially mineable deposits of manganese erratically distributed, but in some areas possibly more widespread

('A century of natural sciences in Indonesia 1850-1950'. Volume commemorating centenary anniversary of Royal Natural Science Society KNV in Indonesia. With contributions on geology (Van Bemmelen), volcanology (Petroeschevsky and Klompe), geophysics (Visser), soil science (Van Baren), botany, zoology, etc.)

Anonymous (1956)- Proeve tot een levensschets van Prof. Dr. Ir. H.A. Brouwer. Verhandelingen Kon. Nederlands Geologisch Mijnbouwkundig Genootschap, Geologische Serie 16 (Gedenkboek H.A. Brouwer), p. XV-XXVI.
(Biography of Prof. H.A. Brouwer. Studied in Delft. Geologist with Netherlands Indies 'Mijnwezen' from 1910-1917, then professor of geology in Delft and Amsterdam. Headed expeditions to Sulawesi in 1929 and Lesser Sunda islands (mainly Timor) in 1937. Many publications on E Indonesia islands and tectonics of Indonesia)

Albers, P.C.H. (2024)- An expedition in colonial times: Some notes regarding Dubois'fieldwork in Sumatra. In: J. Louys et al. (eds.) Quaternary Palaeontology and Archaeology of Sumatra, Terra Australis 56, ANU Press, Canberra, Chapter 3, p. 15-59.
(online at: https://press-files.anu.edu.au/downloads/press/n12084/pdf/ch03.pdf)
(Interesting account of the practicalities of conducting paleontological-archeological excavations in W Sumatra caves by E. Dubois in 1888-1890, incl. the practice of working with convict laborers)

Albers, P.C.H. & J. de Vos (2010)- Through Eugene Dubois' eyes; Stills of a turbulent life. Brill, Leiden, p. 1-185.
(Well-illustrated biography of Dubois, the first man to find and describe 'Java Man' (Pithecanthropus erectus))

Albers, P.C.H., J. Louys & A.E.A. van der Geer (2024)- Eugene Dubois' work in Sumatra. In: J. Louys et al. (eds.) Quaternary Palaeontology and Archaeology of Sumatra, Terra Australis 56, ANU Press, Canberra, Chapter 2, p. 15-59.
(online at: https://press-files.anu.edu.au/downloads/press/n12084/pdf/ch02.pdf)
(Extensive review of two years of W Sumatra cave excavation work by Army physician E. Dubois in 1888-1890. The work was succesful in discovering Late Pleistocene mammal bones, but no remains of primitive Homo)

Bakker, H.J. (2009)- Leven en werk van Franz Wilhelm Junghuhn, 1809–1864: De Humboldt van Java: Een bijdrage tot de geschiedenis van Nederlands-Indië. Bakker & De Vries, Amersfoort, p.

Bakker, J.P. & J.H. Broekman (1963)- In memoriam Prof. Dr. G.L. Smit Sibinga, 30 oktober 1895- 4 september 1963. Tijdschrift Koninklijk Nederlands Aardrijkskundig Genootschap 80, p. 425-428.
(In memoriam of G.L. Smit Sibinga, professor of physical geography in Amsterdam. Published series of (underappreciated?) papers on tectonics of Indonesian archipelago in 1920's and 1930's. Early supporter of Wegener's theory of horizontal movements of continents)

Baks, J. (1989)- De steenkolen-maatschappij "Poeloe Laoet" in Zuidoost-Borneo, 1903-1913. In: A.H.P. Clemens & J.T. Lindblad (eds.) Het belang van de buitengewesten, Economische expansie en koloniale staatsvorming in de Buitengewesten van Nederlands-Indië 1870-1942, Nederlands Economisch-Historisch Archief (NEHA), Amsterdam, Ser. III, 7, p. 123-146. *(read online at: https://www.yumpu.com/nl/document/read/19893087/het-belang-van-de-buitengewesten-acehbooksorg)*
('The coal company "Poeleoe Laoet" in SE Borneo, 1903-1913'. Driving force behind first coal mining development on Palau Laut, SE Kalimantan, from ~1900 was Amsterdam entrepreneur August Jansen, son of P.W. Jansen, a Founding Director of N.V. Deli Maatschappij. Most of technical staff since 1900 was German, initially under 'Bergassessor' H. Weber and later J. Lonsdorfer. Coal production started in 1904. After poor financial results (partly due to mediocre coal quality, which limited demand and price, Laut coal mines were taken over by N.I. government in 1913, partly for strategic reasons. to keep coal out of control of German buyers)

(Report of travels by Portuguese VOC trading agent into interior of Central Sumatra, following discovery of native tin-mines at headwaters of Siak and Kampar Rivers in 1670s)

Bartlett A.G. (1972)- Pertamina- Indonesian National Oil. Amerasian Ltd., p. 1-419.

Barzilay, W.F. (2008)- De ontvangst van Wegeners theorie in Nederland (1916-1968): acceptatie, verwerping en heropleving. Doctor's Thesis, University of Utrecht, p. 1-152.
(online at: www.phil.uu.nl/HPS/theses/WillemjanBarzilay.pdf)
(History of acceptance, rejection and revival of Wegener's 1915' Theory of Continental drift' (the predecessor of plate tectonics) in the Netherlands. Theory was not generally accepted until 1968. Many views on this topic by prominent Dutch geologists like Molengraaff, Brouwer, Wing Easton, Kuenen, Van Bemmelen, Umbgrove, Smit Sibinga, Vening Meinesz, etc., were based on their observations from Indonesia)

Barzilay, W.F. (2009)- De ontwikkelingsgeschiedenis van Rein van Bemmelens (1904-1983) undatietheorie: veertig jaar Nederlandse geologie. Studium (Rotterdam) 2, 1, p. 4-18. *(online at: https://www.researchgate.net/publication/277803239_De_ontwikkelingsgeschiedenis_van_Rein_van_B Etc.)*
('The history of the development of Rein van Bemmelen's (1904-1983) Undation Theory: forty years of Dutch geology'. Review of vB's undation theory, developed in the 1930's, which competed with, but 'lost' against the Plate Tectonics' theory. Van Bemmelen remained an opponent of Plate Tectonics until his death in 1983)

Barzilay, W.F. (2010)- Vening Meinesz and the theory of Wegener. Earth Sciences History 29, 2, p. 213-231.
(On opinion of famous geophysicist Vening Meinesz about Wegener's continental drift theory, and how his view of it changed during his career from support in the 1920's to more skeptical in the late 1930's-1950's, as from his gravity observations suggested oceanic crust is quite rigid, and continents would not be able to 'plough through it'. VM became more accepting again in his 1964 book, after new elements of plate tectonics emerged)

Bastin, J. (1990)- Sir Stamford Raffles and the study of natural history in Penang, Singapore and Indonesia. J. Malaysian Branch Royal Asiatic Society 63, 2 (259), p. 1-25.
(A neglected aspect of the illustrious career of Singapore Governor T.S. Raffles in Malaysia, Singapore and Indonesia is his interest and work as a naturalist. Rafflesia arnoldi Banks was named after Raffles)

Bastin, J. (2019)- The American naturalist Thomas Horsfield in Java. In: Sir Stamford Raffles and some of his friends and contemporaries: a memoir of the founder of Singapore, World Scientific Publishing Co., Singapore, Chapter 3, p. 90-157.
(Extensive history of travels on Java by Pennsylvania-born naturalist T. Horsfield. TH arrived in Java as a Netherlands Indies Army physician in 1801, but was also tasked with investigations of indigenous herbs around Buitenzorg (Bogor). At recommendation of Bataviaasch Genootschap van Kunsten en Wetenschappen, Horsfield was paid by N.I. government as full-time researcher of medicinal plants, but broadened his investigations to other fields of natural history, including 'the mineralogical state of the island'. After the British invasion of Java in 1811, Horsfield continued his research under the patronage of the new governor T.S. Raffles, now mostly based in Surakarta. Horsfield's 'Mineralogical map of Java' in Raffles (1817) was the only geologic map of Java prior to that of F. Junghuhn in the 1840s. In late 1812-1813 Horsfield was commisioned by Raffles to study Bangka island and its tin mines. After the end of British Administration of Java in 1816, Horsfield accepted an invitation from Raffles to move to the British enclave of Bengkulu, Sumatra, in mid-1818)

Bastin, J. (2019)- Thomas Horsfield in Sumatra and London. In: Sir Stamford Raffles and some of his friends and contemporaries: a memoir of the founder of Singapore, World Scientific Publishing Co., Chapter 8, p. 250-267.
(Continuation of the Horsfield story, in West Sumatra from 1818, and sailing to England in 1819 to work on his Java-Sumatra collections as Curator at the East India Company Museum in London until his death in 1859. He was buried at the Fetter Lane Moravian Church, Chelsea)

Bastin, J. & D.T. Moore (1982)- The geological researches of Dr Thomas Horsfield in Indonesia 1801-1819. Bull. British Museum (Natural History), History Series, 10, 3, p. 75-115.

Buxtorf, A. (1923)- Professor Dr. Carl Schmidt 1862-1923. Verhandlungen Schweizerischen Naturforschenden Gesellschaft 104, p. 43-54.
(online at: https://www.e-periodica.ch/digbib/view?pid=sng-005:1923:104#386)
(Obituary of Prof. C. Schmidt from Basel, who did pioneering petroleum geologic in North Sumatra in 1898-1899 for Koninklijke Olie (Royal Dutch Petroleum, before the merger with Shell), including mapping of Perlak structure, saving the 'Koninklijke Olie' company from bankrupcy)

Caspari, R. & M.H. Wolpoff (2012)- The Dubois Syndrome. History and Philosophy of the Life Sciences 34, 1/2, p. 33-42.
(History of Dr. Eugene Dubois, famous for the first discovery and interpretation of hominid Pithecanthropus erectus in C Java, but was later widely viewed as unbalanced, due to his changing understanding of these important fossils. Dubois initially caused much controversy in the religious world with his interpretation of Java Man as the 'missing link' between apes and humans, But, remarkably, by 1930s when science had largely accepted Dubois' interpretation, he changed his mind and viewed the Pitehecanthropus skull cap as a giant gibbon and no longer as an ancestor of modern man, Homo sapiens)

Chrzastek, A., A. Gorecka-Nowak & R. Kryza (2014)- Jozef Zwierzycki, a great geologist of the 20th century (reminiscence 50 year after decease). Geologia Sudetica 42, p. 167-175.
(online at: http://gs.ing.pan.pl/42_PDF/GS42_167-180.pdf)
(Biography of Polish-German geologist Jozef Zwierzycki, who worked at Dutch East Indies Geological Survey from 1914-1938. Numerous mapping and prospecting surveys on Java, Sumatra and New Guinea. Director of Survey from 1933-1938, then retired and returned to Poland. Died in 1961)

Colijn, A.H. (1937)- The Carstensz Massif, 1936. The Alpine Journal, London, 49, 255, p. 177 -189.
(online at: https://www.alpinejournal.org.uk/Contents/Contents_1937_files/AJ49%20177-189%20Colijn%20Carstensz%20Massif.pdf)
(English-language account of the expedition to the snow-covered Carstensz Massif in West New Guinea in October-December 1936, by BPM personnel Colijn, Dozy and Wissel. With map. It was not clear at the time which if the snow-covered Carstensz Group of mountains was the tallest. The expedition reached the tops of the Oost Carstensz and Ngga Poeloe peaks (>4850m high), but failed to reach the top of nearby Carstensz Pyramid (now Puncak Jaya), due to poor weather conditions. Later, it was later determined that Carstensz Pyramid was 22m higher, and remained unclimbed until Austrian mountaineer Heinrich Harrer first reached the top in 1962)

Colijn, A.H. (1937)- Naar de eeuwige sneeuw van tropisch Nederland. De bestijging van het Carstensz gebergte in Nederlandsch Nieuw Guinee. Scheltens & Giltay, Amsterdam, p. 1-279.
('To the eternal snow of tropical Netherlands'. Book on first successful ascent of the snow-covered Carstensz peak (Puncak Jaya) in West Papua in 1936 by NNGPM/ Shell employees Colijn, Dozy and Wissel. On way to mountain they discovered world-class Ertsberg porphyry copper outcrop, mined by PT Freeport since 1973)

Condon, M.A., N.H. Fischer & G.R.J. Terpstra (1958)- Summary of oil-search activities in Australia and New Guinea to the end of 1957. Bureau Mineral Resources Geology Geophysics (BMR), Report 41, p. 1-101.

(online at: www.ga.gov.au/products-services/legacy-publications/reports.html)

Corbin, H.B. (1921)- Searching for gold in Sumatra. Netherlands Indies Review 2, 5, p. 208-209.
(Brief summary of Australian mining engineer H.Burton Corbin's approach to gold prospecting in Sumatra since 1906. Corbin notes that Sumatra is full of promise for gold deposits (of course, native gold mining had already been ongoing there for centuries; JTvG). Includes mention of economic Ajer Mangani deposit, for which a new company Mijnbouw Maatschappij Aequator was created))

Cramer, P. (1952)- Nachruf auf Eduard Hartmann. Annual Geologica Bavaria 14, p. 171-174.
(online at: www.zobodat.at/biografien/Hartmann_Eduard_Geologica_Bavarica_14.pdf)
(Memorial for Dr. E. Hartmann (Munchen 1887-1951), German geologist who followed Hans Cloos in geological mapping work for Standard Oil Co. (NKPM) in Java from 1913-1915, then worked with the Dienst van het Mijnwezen (Geological Survey) in Batavia from 1915-1921, mainly in Sumatra, New Guinea and Java)

Crawfurd, J. (1820)- History of the Indian Archipelago, containing an account of the manners, arts, languages, religions, institutions, and commerce of its inhabitants. Archibald Constable and Co., Edinburgh, 3 volumes (Vol. 1, p. 1-520, vol. 2, p. 1-563, vol. 3, p. 1-554)
(online at: https://eresources.nlb.gov.sg/printheritage/detail/0469b121-f1eb-4958-a97b-d8a2f3a067d1.aspx)
(Early English-language description of the Indonesian archipelago by British overnment official and contemporary of Sir Stamford Raffles. John Crawfurd (1873-1868) stayed in Java in 1811-1816, during the entire British Interregnum. Crawfurd introduced name 'Indian Archipelago' which became the most popular name (after 'Malay Archipelago') in the English-speaking world for what is now the Indonesian archipelago. A Dutch edition was published in Haarlem (1823-1825) as 'De Indische Archipel, in het bijzonder het eiland Java beschouwd in de zeden, wetenschappen, etc.')

Crespin, I. (1975)- Ramblings of a micropalaeontologist. Bureau Mineral Resources Geology Geophysics (BMR), Record 1975/83, p. 1-61.
(online at: www.ga.gov.au/corporate_data/13323/Rec1975_083.pdf)
(Autobiographic notes on travels of Australian micropaleontologist Irene Crespin, including an April 1939 visit to Indonesia to meet (1) Dr. Tan Sin Hok at Geological Survey in Bandung and (2) oil company micropaleontologists H. Thalmann and H.J. MacGillavry at the Nederlandsche Koninklijke Petroleum Maatschappij (NKPM (Stanvac) in Sungei Gerong (Palembang))

Cuder, G. & E. Stevens (1984)- Dipl.-Ing. Dr. Reinout Willem van Bemmelen 1904-1983. Carinthia II, 174, p. 433-435.
(online at: https://www.zobodat.at/pdf/CAR_174_94_0433-0435.pdf)
(One of several obituaries for R.W. van Bemmelen, famous for his major 1949 book on the Geology of Indonesia)

Darini, R. (2023)- The oil industry in Pangkalan Brandan, 1890–1930's. In: R.H.E. Sendouw et al. (eds.) Proc. Unima Int. Conf. on Social Sciences and Humanities (UNICSSH 2022), Manado, ASSEHR 698, p. 1199-1211.
(online at: https://www.atlantis-press.com/proceedings/unicssh-22/125983946)
(Brief review of oil town Pangkalan Brandan town in Langkat, NE Sumatra, before, during and after its expansion as BPM oil processing and distribution center in 1890s- early 1900s. No figures)

Davies, H.L. (1987)- Evan Richard Stanley, 1885-1924: Pioneer geologist in Papua New Guinea. BMR J. Australian Geology Geophysics 10, 2, p. 153-177.
(online at: https://d28rz98at9flks.cloudfront.net/81215/Jou1987_v10_n2_p153.pdf)
(Evan Richard Stanley was first Government Geologist for (Australian) Papua, from 1911-1924. His geological investigations under difficult conditions resulted in >50 papers and reports and the first comprehensive accounts in 1923-1924 of geology and resources of New Guinea and Papua territories. Stanley died unexpectedly in 1924 in Adelaide, South Australia)

DeBlasio, A. (2023)- Kepada kawan saya, Merapi (On my friend, Merapi): Vladimir Petrushevsky at the Volcanological Survey. In: A. Bobbette et al. (eds) Berita Gunung Berapi: Politik kebumian pada zaman vulkanik. Reading Sideways Press, Leiden & Yogyakarta, p. 235-264. *(limited edition print 'book'?)*

De Bruin, J. & L. Pyenson (1985)- 'Gentleman-scientist': Elie van Rijckevorsel and the Dutch overseas effort in exact sciences at the end of the nineteenth century. Annals of Science 43, 5, p. 447-473.
(Examination of geophysical (magnetic) surveys of Indonesia and Brazil by Elie van Rijckevorsel (1845–1928) during 1870-1890. The decision of Van Rijckevorsel, an independently wealthy 'man of learning', to carry out a magnetic survey of the Malay Archipelago (Indonesia) spurred colonial authorities in The Hague to endow the finest geomagnetic observatory in the tropics (Meteorological and Geophysical Observatory in Batavia))

Decker, R.W. (1960)- Geophysics in Indonesia 1921-1961. Madjelis Ilmu Pengetahuan Indonesia (MIPI; now LIPI), Penerbitan 2, Contributions Department of Geology, Institute of Technology Bandung (ITB) 35, Geology Symposium, p. 67-97.
(Review by one of the American 'Kentucky Group' geoscientists, who came to work in Bandung after Dutch professors had been expelled in 1957)

Decker, R.W. (1963)- Status of geophysical investigations in Indonesia. In: G.A. Macdonald (ed.) Geology and solid Earth geophysics of the Pacific Basin, 10th Pacific Science Congress series, University of Hawaii Press, Honolulu, p. 69-78.
(Present status and history of geophysical activity in Indonesia, especially since First Pacific Science Congress in 1920 (seismology, gravity, magnetism, physical oceanography). Shortened version of Decker (1960))

Deecke, W. (1913)- Georg Boehm†. Zentralblatt Mineralogie Geologie Palaontologie 1913, p. 289-295.
(online at: www.zobodat.at/biografien/Boehm_Georg_Centralblatt-Mineral-Geol-Palaeont_1913_0289-0295.pdf)
(Obituary for Georg Boehm, who traveled to the Sula islands, Misool and Buru in Eastern Indonesia in 1899-1900, in search of Mesozoic fossils. This resulted in a series of classic paleontological monographs by Boehm, Wanner, Krumbeck, Soergel, Von Seidlitz and others)

De Graaf, G. (2021)- De Indische Mijnspoorwegen, Het boven- en ondergronds spoorwegbedrijf bij de Staats- en particulire kolenmijnen in voormalig Nederlands-Indie 1849-1958. Uitgeverij De Alk bv, Akmaar, p. 1-195.
('The Indies mine railways, the above and below ground rail operations at the state and private coal mines in the Netherlands Indies, 1849-1958'. Thorough, well-illustrated review, with much information on histories of coal mines in Sumatra, Kalimantan and Java)

(online at: https://www.zobodat.at/pdf/MittGeolGes_56_0679-0682.pdf)
(Obituary of Prof. Theo Klompe, petroleum geologist with NKPM/ Stanvac from 1929-1942, prisoner of war from 1942-1945. Professor of geology at University of Indonesia (now ITB), Bandung, from 1948-1958, and at Chulangkorn University, Bangkok, from 1958-1962)

Katili, J.A. (1980)- Geological and geophysical research in Southeast Asia: the state of the art. In: A.Y. Takenouti (ed.) The Kuroshio IV, Proc. 4th Symposium for the Co-operative study of the Kuroshio and adjacent regions. Symposium, Tokyo 1979, Tokyo Academy, p. 1-14. *(also in Katili 1985- Advancement of geoscience in the Indonesian region, p. 135-148)*

Katili, J.A. & H.M.S. Hartono (1979)- Van Bemmelen's contributions to the growth of geotectonics and the present state of earth-science research in Indonesia. In: W.J.M. van der Linden (ed.) Fixism, mobilism or relativism: Van Bemmelen's search for harmony, Geologie en Mijnbouw 58, 2, p. 107-116.
(online at: https://drive.google.com/file/d/0B7j8bPm9Cse0dTZKckNEU01sMEE/view)
(Undation theory, launched in Indonesia by Van Bemmelen, had great impact on development of earth sciences. First envisaged as fixistic concept, theory was later developed into mobilistic one which accommodates continental drift and sea-floor spreading hypothesis, but instead of accepting theory of extensive rigid plates it utilised rheological approach for island arcs. Geotectonic evolution of Indonesia is presented in this paper)

Kazmer, M. (2022)- Posewitz Tivadar es a Borneo. Foldtani Kozlony (Bull. Hungarian Geological Society) 152, 1, p. 77-90.
(online at: https://ojs3.mtak.hu/index.php/foldtanikozlony/article/view/5551) (in Hungarian)
('Theodor Posewitz and his Borneo'. Overview of the life of T. Posewitz (1850–1917), a Hungarian medical doctor and Freiberg-Bergakademie-trained geologist/mining engineer who worked in Dutch East Indies between 1880 and 1885, as medical officer in Dutch colonial army, on Java, Borneo and Bangka islands, but dedicated all his spare time to geological exploration and study. His main work was the book 'Geology of Borneo', first published in German (1889), translated into English in 1892. With extensive bibliography of Posewitz' Asia publications)

Kazmer, M. (2024)- Theodor Posewitz and his Borneo (1889)- The first geological monograph of the island. Earth Sciences History 42, 2, p. 460-474.
(online at: https://www.researchgate.net/publication/377131492_THEODOR_POSEWITZ_AND_HIS_BORNEO_1889_-_THE_FIRST_GEOLOGICAL_MONOGRAPH_OF_THE_ISLAND)
(English-language version of paper above. About Theodor Posewitz (1850–1917), a Hungarian medical doctor and geologist, who spent five years in the Dutch East Indies (1880 and 1885). Best known forthe first monograph on the geology of Borneo, published in German in 1889 and in English in 1892)

Kemmerling, G.L.L. (1927)- In Memoriam Dr. R.D.M. Verbeek. De Mijningenieur 7, 5, p. 79-80.
(Brief obituary of R.D.M. Verbeek, who died at age 81 on May 1927. After 33-year career of geological field surveys with Bureau of Mines of the Netherlands Indies Verbeek continued to be active in Indonesia geology for 25 more years)

Kemmerling, G.L.L. (1929)- In Memoriam Dr. P.F. Hubrecht. Jaarboek Geologisch-Mijnbouwkundig Genootschap Nederland Kolonien 1929, p. 6-10.
(Obituary of Dr. Paul Francois Hubrecht, who, after studying in Utrecht and Heidelberg, participated as geologist in three New Guinea expeditions: 1910-1912 (Dutch-German Border Expedition), in 1912 (which reached Wilhelmina Peak from the S coast) and 1920-1921 (which reached Wilhelmina Peak from the Mamberamo River along the North coast). From July 1923 he became director of several sugar plantations on Java. Died early, at age 48)

Keppner, G. (2006)- Wie weit bis Airmolang? Pro Business Digital, Berlin, p. 1-535.
('How far to Airmolang?'. Thorough biography of German geologist Dr. K.A.F.R. Musper and his family in Indonesia, by German geophysicist/author G. Keppner. Musper spent most of his career with the Dienst van den Mijnbouw in Sumatra and Bandung, and made numerous significant contributions to geological mapping in Sumatra and Java in the 1920s-1930s. Musper was wrongfully arrested in Bandung in 1940 and died in a Dutch prison camp in Surinam in 1942. The title refers to Musper's agonizing trip down the Indragiri River from his base camp in Taluk to the Air Molek (Ayer Moelik) rubber plantation in 1924, to seek medical help for his dying wife. Medical help came too late and Mrs. Musper passed away soon after arrival at Air Molek)

Kirsch, P. (1995)- Goldbergbau der Niederlandischen Ostindischen Kompanie auf Sumatra 1670 bis 1737. Die Berichte der deutschen Bergleute Elias Hesse und Johann Wilhelm Vogel. Kleine Beitrage zur Europaischen Uberseegeschichte 27, Bamberg, p. 1-33.
('*Gold mining by the Dutch East India Company on Sumatra 1670 until 1737. Based on the reports from Saxon (German) miners Elias Hesse and Johann Wilhelm Vogel'*)

('The Bangka drill. a classic among innovations'. Story of the widely used shallow coring tool, first developed by Akkersdijk for the alluvial tin deposits on Bangka Island))

Mansyur (2013)- From Oranje Nassau to Pulau Laut: The invest of coal mining in Southeast Kalimantan from 1845 to 1931. Historia 14, 2, p. 323-336.
(online at: https://ejournal.upi.edu/index.php/historia/article/view/2037/1420)
(Brief history of Dutch coal mining in SE Kalimantan since the mid-1850s and on Pulau Laut since 1903, Initial coal exploitation on Pulaua Laut was by the private 'Palau Laut Syndicate'. It was sold to the Dutch East Indies Government in 1912. The global economic crisis of 1931 led to the end of coal mining on Palua Laut)

Manten, A.A. (1966)- In memoriam F.A. Vening Meinesz. Tectonophysics 3, 5, p. 369-373.
(online at: https://www.oalibrary.org/papers/view/0c6dc922-d7fb-49e8-870c-c0c5995d4175/)
(Memorial of Professor Felix Vening Meinesz (1887-1966), professor of Geodesy and Geophysics at University of Utrecht. Famous for pioneering marine gravity surveys, in particular his work in navy submarines in Indonesian region in 1930's. His discovery of narrow belt of unusually low negative gravity over trench/ accretionary prism around Sunda-Banda active volcanic arcs was interpreted as zone of 'crustal downbuckling', and was early indication of the subduction process)

Marks, P. & C.W. Drooger (1983)- Levensbericht van Gustav Heinrich Ralph von Koenigswald (13 november 1902- 10 juli 1982). Jaarboek Koninklijke Nederlandse Akademie van Wetenschappen, Amsterdam, 1983, p. 156-163.
('Obituary of G.H.R. von Koeningswald' (1902-1982), former vertebrate paleontologist/ anthropologist with Geological Survey, Bandung during the 1930s-1940s. After World War II Professor at the University of Utrecht and Senckenberg Institute, Frankfurt. Known primarily for his contributions to hominid and vertebrate paleontology in Indonesia and SE Asia and documentation of tektite localities in Indonesia from the Pleistocene Australasian impact strewn field)

Marsden, W. (1784, 1811)- The history of Sumatra. Containing an account of the government, laws, customs and manners of the native inhabitants, with a description of the natural productions, and a relation of the Ancient political state of that island. 2n Ed., Thomas Payne, London, p. 1-373.
(Early, thorough historic description of people and natural environment of Sumatra, by former British secretary of Fort Marlborough. First edition published in 1784; 3rd Ed. published during the British Interregnum in 1811; several later editions/ reprints)

Martadiradja, J. (2011)- Sang Perintis: Arie Frederick Lasut & Soenoe Soemosoesastro. GEOMAGZ Juni 2011, p. 28-33.
('The pioneers, Arie Frederick Lasut & Soenoe Soemosoesastro')

Martin, K. (1910)- Junghuhns Ansichten uber die versteinerungsfuhrenden Sedimente von Java. In: Gedenkboek Franz Junghuhn 1809-1909, Nijhoff, The Hague, p. 95-104.
(online at: https://www.delpher.nl/nl/boeken/view?identifier=MMKB18:008435000:00006 Etc.)
('Junghuhn's views on the fossil-bearing sediments of Java'. Junghuhn gathered a significant collection of Neogene fossils from Java, which were turned over to J.A. Herklots at the Natural History Museum in Leiden, who recognized 500 mostly unnamed species)

Martin, K. (1916)- Prof. Dr. G.A.F. Molengraaff. Jaarboek Mijnbouwkundige Vereeniging Delft 1915-1916, p. 35-
(online at: http://lib.tudelft.nl/mscans/mscans0085)

Massachusetts Institute of Technology Center for International Studies (1957)- Stanvac in Indonesia. Ayer Publishing, p. 1-118.
(History of Stanvac oil company, consortium of Standard Oil of New Jersey (Exxon) and Socony Vacuum (Mobil))

Mealey, G.A. (1996)- Grasberg- Mining the richest and most remote deposit of copper and gold in the world, in the mountains of Irian Jaya, Indonesia. Freeport.McMoRan Copper & Gold Inc., New Orleans, p. 1-327.
(Book on hiistory of discovery and development at Ertsberg and Grasberg copper-gold mines, W Papua)

Messer, A. (1994)- Effects of the Indonesian National Revolution and transfer of power on the scientific establishment. Indonesia (Cornell University Press) 58, p. 41-68.
(Indonesian independence and subsequent transfer of sovereignty in 1949 changed structure of scientific research organizations. Before this, vigorous research programs in many areas of science were carried out under Dutch-administered research institutes and universities. The forced exodus of Dutch scientists after transfer of power removed much of intellectual capital from the Indonesian research effort)

Meyer, H. (1949)- Fremde Sonne uber Sumatra: Erlebnisbericht eines Schweizer Geologen. Ex-Libris Verlag, Zurich, p. 1-197.
('Foreign sun over Sumatra: experiences of a Swiss geologist'. History of Swiss BPM geologist Hans Meyer during the Japanese occupation in 1942-1945. Before the war, Meyer worked in Pangkalan Brandan (C Sumatra) and Plaju (S Sumatra), where he was arrested by Japanese in 1942. Imprisoned in Lahat, Palembang prison, etc.)

Mierzejewski, M.P. (2012)- O splataniu sie codziennosci z wielkoscia na przykladzie zycia i dzialalnosci Sp. Profesora Jozefa Zwierzyckiego. Przeglad Geologiczny 60, 11, p. 593-595.

(In Hungarian. 'In memory of the 150th anniversary of the birth of dr. Tivadar Posewitz'. Hungarian Dr.TheodorPosewitz. (1850-1917) was an army physician in Netherlands Indies and later Geologist at the Royal Hungarian Geological Institute (1888-1916). In 1879-1884 he worked in Java, Borneo and Bangka, and devoted all his spare time to geological research. The best-known of his many geological papers was the book 'Borneo', published in German in Berlin (1889) and in English in London (1892) (the first book on the geology and natural resources of Borneo). Back in Hungary TP conducted geological research in the NE Carpathians. In 1898 he wrote Hungarian- and German-language tourist guide books on the Hungarian (now Slovakian) Carpathians area). In 1906 he published an extensive review on 'Petroleum and asphalt in Hungary')

(Continuation of Verbeek series of 'Netherlands Indies' geology bibliography, supplements 21-22, listing papers nrs. 5519-5959, published 1935, 1937) (Final volume called IV-'23e vervolg', by J. Steenhuis (1951, p. 1-117))

XIV. INDONESIA GEOSCIENCE LITERATURE SOURCES

The publications listed in this Bibliography of Indonesia/ SE Asia geoscience come from an overwhelming body of published information. Below is a listing of the principal ~415(!) journals and regularly scheduled Conference Proceedings, in which geoscience papers on the Indonesian region have been published since the mid-1800s, listed under the organizations that published them.

They have here been categorized as:
XIV.1: Pre-1945 Dutch colonial era journals (23 journals/periodicals);
XIV.2: Post-1945 Indonesian Government geoscience Institutes and journals (33 journals/ periodicals);
XIV.3: Indonesian Professional Geoscientists Associations (21 journals/ periodicals);
XIV.4: Indonesian Universities/ Academic institutes (31 geoscience departments with ~65 geoscience journals);
XIV.5. Circum-Indonesia and other International Geoscience Organizations (149 journals);
XIV.6. International Commercial Geoscience Publishers (nine leading publishers with 104 geoscience journals, plus an additional 22 miscellaneous international journals

These numbers do not include 910 academic theses with Indonesia/ SE Asia geoscience content, from universities all over the world, 100s of standalone books, and the vast amount of proprietary geoscience data in industry and government files.

Wherever available, online links to journals are provided. However, as noted above, although links in this Bibliography were correct at the time of writing, websites frequently move or are being updated or taken offline, so many of the links in this Bibliography may no longer be valid. But, knowing a title or author's name generally allows for its new 'home' to be found at a new web address, via Google or other search engines.

This listing below only includes geoscience journals or science journals with significant geoscience content for Indonesia or SE Asia. General science journals in Indonesia/ SE Asia with only occasional geoscience content are not listed here. It includes about 96 journals or publication series, published in Indonesia (including the Netherlands Indies) since the mid-1800s. It may be noted that this this list is probably not 100% complete.

Many historic volumes on the geology of Indonesia, including the '*Jaarboek van het Mijnwezen*' are available online from *www.google.com*, *https://archive.org* or *https://catalog.hathitrust.org*, etc., and some were reprinted by Nabu Press/ Bibliolife LLC, S. Carolina, USA, and others. Unfortunately the vast majority of these digital reproductions do not (adequately) copy oversized folded plates (which are generally the most valuable parts of the reports), thus severely limiting the value of these digital and paper reprints.

XIV.1. Pre-1945 Dutch colonial period Geological Organizations/ Journals

This chapter lists the main organizations responsible for geoscience research and publishing during the Dutch colonial era, since the 1840s until Indonesian Independence. Four were based in the Netherlands Indies, five in the Netherlands. Between them we identified 23 journals and regular publications series

1. DIENST VAN HET MIJNWEZEN (1850-1924; Bogor, Weltevreden (Batavia)); renamed to:
DIENST VAN DEN MIJNBOUW (1924-1949, Bandung**)**
(The Netherlands Indies Bureau of Mines/ Geological Survey; predecessor of the current Geological Survey of Indonesia and Geological Museum in Bandung)

1. Jaarboek van het Mijnwezen in Nederlandsch Oost-Indie (vols. 1-52; 1872-1923) /
(1a. Jaarboek van het Mijnwezen in Nederlandsch-Indie (vols. 53-68; 1924- 1939) (391)
("Yearbook of the Department of Mines in Netherlands (East) Indies").
(Published annually with 2 parts: 'Technisch-Administratief' (Technical/Administrative) and 'Wetenschappelijk' (Scientific). Since vol. 39 (1910) separate volumes were published as 'Algemeen Gedeelte' (General volume; on activities, personnel, etc.) and one or multiple volumes of 'Verhandelingen' (Transactions, i.e. scientific reports). From vol. 26 (1897) also separate Atlas volumes for major reports. After the global economic downturn in 1930, this series became much diminished)
2. Wetenschappelijke Mededeelingen- Dienst van den Mijnbouw-(1924-1940) (49)
('Scientific Contributions- Bureau of Mines', Bandung)
- 28 volumes published; mainly on paleontology topics, 3 volumes on petrography.
- Continued as Djawaten Geologi and Publikasi Keilmuan, vols. 29-33, in 1955-1957)
3. Vulkanologische Mededeelingen- (1921-1940) *('Volcanological contributions'-)* (18)
- After 1928 named 3a. Vulkanologische en Seismologische Mededeelingen*)*
- 13 monographs on active volcanoes of Indonesia; discontinued in 1940, at start of WWII)
4. Bulletin of the Netherlands Indies Volcanological Survey (issues 1-98, ~1927-1941)
- Newsletters on volcanic activity by Heads of Volcanology Department, Bandung.
5. Verslagen en Mededeelingen betreffende Indische delfstoffen en hare toepassingen (22)
('Reports on Indies economic minerals and their applications') (vols. 1-23, 1917-1940)
6. De Mijningenieur *('The Mining engineer')* (1920-1933; vols. 1-14) (108)
- published by the 'Vereeniging van Ingenieurs en Geologen bij den Dienst van den Mijnbouw in Nederlands Oost-Indie', (personnel of the Bureau of Mines/ Geological Survey, Bandung)
- short papers on mining and geology in Indonesia
(very rare!; vols. 1-3 online at: https://catalog.hathitrust.org/Record/100160354);
- after 1934 continued as *Section IV-Mijnbouw* in *De Ingenieur in Nederlandsch Indie (see below)*
7. Geological map***s*** produced before 1941 (planned countrywide coverage never completed) (30)
- Geological overview maps Netherlands East Indies Archipelago 1: 1,000,000 (1915-1932)
(12 of 21 planned sheets published)
- Geologische kaart van Sumatra 1: 200,000 (1927-1937; incomplete series; 13 sheets published)
- Geologische kaart van Java 1: 100,000 (1927-1941; incomplete series; 11 sheets published)

2. KONINKLIJK INSTITUUT VAN INGENIEURS (KIVI) - GROEP NEDERLANDSCH-INDIE
(Royal Institute of Engineers- Netherlands Indies Chapter, Batavia)

8. De Ingenieur in Nederlandsch-Indie (*'The Engineer in Netherlands Indies'*), 1934-1942. (127)
- General engineering monthly with Section IV- *Mijnbouw* (Mining) (successor of '*De Mijningenieur*')
- vols. 1-9 (final issue 9-1, January 1942);
- many issues available online at: *http://colonialarchitecture.eu/obj?sq=id:jn:15.* or at:
https://www.stichtingblauwelijn.nl/tresor/watermeesters/de-ingenieur-in-nederlandsch-indie/
After Indonesian Independence continued, until closed down by Indononesian government, as:
8a. De Ingenieur in Indonesie (*'The Engineer in Indonesia'*), 1948-1957, vols. 1-9 (9)

3. KONINKLIJKE NATUURKUNDIGE VEREENIGING IN NEDERLANDSCH INDIE (KNV)
('Royal Natural Sciences Society in the Netherlands Indies', Weltevreden (Batavia) (since 1850)

9. Natuurkundig Tijdschrift voor Nederlandsch-Indie (1850- 1940, vols. 1-100) (135)
('Journal of Natural Sciences for the Netherlands Indies'). The leading natural history journal of the Netherlands Indies, and also main outlet for Dienst van het Mijnwezen in 1854-1872)
- Continued as:
9a. Natuurwetenschappelijk Tijdschrift van Nederlandsch Indie (1941-1942,1946) (0)
9b. Chronica Naturae (1947-1950; vols. 103-106) (14)
9c. Indonesian Journal for Natural Science/ Madjalah Ilmu Alam untuk Indonesia (1951- 1957; vols. 107-113) (31)
- Selected issues digitized and online at: *www.biodiversitylibrary.org/bibliography/13350*
- Chronica Naturae also online at: *http://colonial.library.leiden.edu/...*

4. KONINKLIJK NEDERLANDS AARDRIJKSKUNDIG GENOOTSCHAP (KNAG), Amsterdam
(Royal Netherlands Geographic Society)

10. Tijdschrift van het Koninklijk Nederlands Aardrijkskundig Genootschap (since 1876) (156)
('Journal of the Royal Netherlands Geographic Society'), Amsterdam/Utrecht)
- with many papers on geography and travels in Indonesia, some with geological observations.
- most older issues online at: *www.delpher.nl/*
- also information on KNAG-sponsored expeditions to Central Sumatra (1879) and western New Guinea (1939, 1959) (online at: *www.knag-expedities.nl/pages/expedities.php*)

5. KONINKLIJKE NEDERLANDSE AKADEMIE VAN WETENSCHAPPEN (KNAW), Amsterdam
(Royal Netherlands Academy of Sciences)
11. Proceedings Koninklijke Nederlandse Akademie van Wetenschappen Amsterdam (242)
General science publications series, with occasional papers on geology/-geophysics/paleontology of Indonesia, especially before ~1960.
12. Verslagen Koninklijke Akademie van Wetenschappen, Amsterdam (27)
13. Verhandelingen Koninklijke Nederlandse Akademie van Wetenschappen (13)
(xx) Special volumes series Royal Netherlands Academy of Sciences, Amsterdam

6. KONINKLIJK NEDERLANDS GEOLOGISCH MIJNBOUWKUNDIG GENOOTSCHAP, Delft
(Royal Netherlands Geological and Mining Society (KNGMG), Delft; founded in 1912).
14. Geologie en Mijnbouw *('Geology and Mining'; 1923-2004)* (153)
- General geology journal, with many papers on Indonesia geology before ~1960.
- pre-1962 journal issues online at: *https://www.kngmg.nl/geologie-en-mijnbouw-portal-pre-1961/)*
- post-1961 issues at: *https://www.kngmg.nl/wp-content/uploads/2016/03/Index_1961_2004.pdf*
15. Verhandelingen van het Koninklijk Nederlands Geologisch en Mijnbouwkundig Genootschap (21)
('Transactions of the Royal Netherlands Geological and Mining Society'; since 1912)
- with many papers on Indonesia geology and mining before ~1960.

7. RIJKSMUSEUM VAN NATUURLIJKE HISTORIE/ NATURALIS, Leiden
(National Museum of Natural History; since 2010 *Naturalis Biodiversity Center*, Leiden).
- This museum played a big part in early natural history expeditions to the Netherlands Indies//Indonesia since the 1820s, and in the study of objects collected there (incl. paleontology, geology).
- Mutiple publication series since late 1800's (most online at: *www.repository.naturalis.nl/):*

16. Sammlungen des Geologischen Reichsmuseums in Leiden (1881-1924) (82)
('Proceedings of the National Geological Museum in Leiden'; mainly collections of papers on fossils from across the 'Netherlands Indies', especially by Prof. K. Martin). Continued as:
17. Leidsche Geologische Mededelingen (with University of Leiden (1925-1983) (85)
18. Scripta Geologica (1971-2015) (43)
19. Zoologische Mededelingen (29)
20. Zoologische Verhandelingen (8)

8. TECHNISCHE HOGESCHOOL (TH), Delft

(Technical University, Delft)

21. Jaarboek van de Mijnbouwkundige Vereeniging te Delft (1903-1949). (16)
(*'Yearbook of the Mining students organization, Technical University, Delft'*)

- Delft mining engineering students yearbooks, which include presentations on Indonesia geology and alumni moves (the majority of geologists and mining engineers in the Netherlands Indies were trained in Delft)
- online at: *https://tresor.tudelft.nl/tijdschrift/jaarboeken/*

9. NATUURWETENSCHAPPELIJK CONGRES NEDERLANDSCH-INDIE, Batavia

22. Handelingen xx Nederlandsch-Indisch Natuurwetenschappelijk Congres (1919-1938) (21)
(Transactions of the xx Netherlands Indies Natural Sciences Congress, 1-8)
(Number 1 (Weltevreden/Batavia-1919), 2 (Bandung-1922), 3 (Bogor-1924), 4 (Batavia-1926), 5 (Surabaya-1928), 6 (Bandung-1931), 7 (Batavia-1935), 8 (Surabaya-1938))

10. NOVA GUINEA REPORTS SERIES, Brill Publishers, Leiden

23. Nova Guinea. Uitkomsten der Nederlandsche Nieuw-Guinea-Expeditie(s) in 1903-1926
('Nova Guinea. Results of the Netherlands New Guinea expeditions...')

- Classic journal series documenting ethnological, biological and geological results of early expeditions to western New Guinea (Papua).
- Published by E.J. Brill, Leiden, in 1903, 1907, 1909, 1912-1913, 1920, 1926, etc.
- Series 1: Vols. 1-18 (1909-1936); New series: vols. 1-10 (1937-1967) (>90% of papers on biology)

XIV.2. Post 1945 - Indonesian Government Geoscience Institutes and Journals

This chapter is a listing of nine main Government institutes in Indonesia in the fields of geoscience research or applied geoscience. Between them, they publish (or published) ~33 journals or regular series of Convention Proceedings, etc..

1. **BADAN GEOLOGI (Geological Agency, Geological Survey of Indonesia)**, Bandung
(Post-Independence successor of the *Dienst van het Mijnwezen/ Dienstvan den Mijnbouw* (1850-1942) and *Chisitu Chosayo* (1942-1945). Many name changes, incl. *Jawatan Tambang dan Geologi* (1945-1962), *Djawatan Geologi* (1956-1963) *Direktorat Geologi/Geological Survey of Indonesia* (1963-1978), *Geological Research and Development Centre* (GRDC; 1978-2005), *Badan Geologi*, *Pusat Survei Geologi* (2005- now).
- Website: *https://geologi.esdm.go.id/*
- All GRDC titles, including numerous geological map sheets: (540)

1. Djawatan Geologi, Publikasi Teknik- Seri Geologi Ekonomi / Paleontologi/ Geofisika (1960-1974?) (15)
2. Geological Research and Development Centre (GRDC) Special Publications (1-38; 1978-2009) (117)
3. Bulletin Geological Research and Development Centre (GRDC) (1-21; 1979-1997) (80)
4. GRDC, Seri Paleontologi (Paleontology Series) (1-10; 1981- 1999) (45)
5. Jurnal Geologi Indonesia (Indonesian Journal of Geology) (JGI; vols. 1-8, 2006-2013) (88)
*(*online at: *https://www.neliti.com/journals/indonesian-journal-on-geoscience/catalogue)*
6. continued as Indonesian Journal on Geoscience (IJOG) (vols. 1-12/3, 2014-2025) (114)
*(*online at: *https://ijog.geologi.esdm.go.id/index.php/IJOG/issue/archive)*
7. Jurnal Sumber Daya Geologi (JDSG) (J. of Geological Resources) (vols. 1-23; 1991-2013) (181)
(vol. 16-23 online at: *https://jgsm.geologi.esdm.go.id/index.php/JGSM/issue/archive*)
8. Jurnal Geologi dan Sumberdaya Mineral (JGSM; J. of Geology and Mineral Resources) (325)
(vols. 1-26/1, 1991-2025)
(vols. 14-26 online at: *https://jgsm.geologi.esdm.go.id/index.php/JGSM/issue/archive)*
9. Buletin Sumber Daya Geologi (BSDG) (vols. 1-20/1, 2006-2024) (36)
(online at: *https://buletinsdg.geologi.esdm.go.id/index.php/bsdg/issue/archive*)
10. Warta Geologi (2006-2010; popular magazine, with same name as a Geol. Soc. Malaysia magazine)
*(*vols. 1-5 online at: *http://www.bgl.esdm.go.id/index.php/koleksi-warta-geologi)*
11. GEOMAGZ Majalah Geologi Populer (continuation of Indonesian Warta Geologi) (9)
Popular geology journal, since 2011; discontinued in 2016)

*(*vol. 1-6 online at: *https://geologi.esdm.go.id/en/publikasi/jurnal-publikasi-khusus)*

12. Jurnal Lingkungan dan Bencana Geologi (JLBG) (Journal of Environment, Geological disasters) (3)
(vols. 1-15, 2010-2024) (online at: *https://jlbg.geologi.esdm.go.id/index.php/jlbg/issue/archive*)
13. Buletin Geologi Tata Lingkungan (Bulletin of Environmental Geology) (vols. 1-30, 1983-2020) (6)
14. Publikasi Ilmiah Pendidikan dan Pelatihan Geologi (vols. 1- 12?, -2016))
('Scientific Publication for Education and Geology Training')
15. Geological maps of Indonesia, at scales 1:250,000 and 1: 1,000,000; Java also 1:100,000. *(many)*
16. Thematic maps: Metallic mineralization, Sedimentary basins, Gravity, Earthquakes, Volcanoes, etc.

2. INDONESIAN INSTITUTE OF SCIENCES (LIPI), Research Center for Geotechnology, Bandung
- Formerly Lembaga Geologi dan Pertambangan Nasional (National Institute of Geology and Mining)
Now: Badan Riset dan Inovasi Nasional (BRIN; National Research and Innovation Agency)
- Website: *www.geotek.lipi.go.id*
- Online Indonesian Scientific Journal Database: *http://isjd.pdii.lipi.go.id/*

1. Bulletin of National Institute of Geology and Mining Bandung (NIGM) (vols. 1-5, 1968-1975) (22)
(a few issues online at: *https://jrisetgeotam.brin.go.id/index.php/NIGM/issue/archive*)
(replaced by journal below:)
2. Jurnal RISET Geologi dan Pertambangan (Indonesian Journal of Geology and Mining) (88)
(now RISET Geologi dan Pertambangan (Geology and Mining Research)
(vols. 1-10 (1977-1991) online at: *http://pustaka.geotek.lipi.go.id/index.php/category/jurnal/riset/)*
(vols. 15-35 (2005-2025) online at: *https://jrisetgeotam.brin.go.id/index.php/jrisgeotam/issue/archive*)
3. Proceedings Annual LIPI Geoteknologi Research Conferences (since 1995, stopped in 2017?) (x)
(2006-2011 online at: *https://jrisetgeotam.lipi.go.id/index.php/proceedings/issue/archive*)
4. Marine Research in Indonesia (MRI) (Penjelidikan Laut di Indonesia; published since 1956)
(online at: *https://mri.lipi.go.id/index.php/MRI/issue/archive*) (online service inactive 4/2024?)

3. LEMIGAS (Pusat Penelitian dan Pengembangan Teknologi Minyak dan Gas Bumi), Jakarta
(formerly Lembaga Minyak dan Gas Bumi; R&D Centre for Oil and Gas Technology)
- Website: *www.lemigas.esdm.go.id*
(Lemigas website(s) changed frequently. and tend to be incomplete and slow)

1. Scientific Contributions Oil & Gas (SCOG), vols. 1 (1977)- 48 (2025) (46)
(formerly called Lemigas Scientific Contributions) (vols. 5-47 (1982-2024)
(online at: *https://journal.lemigas.esdm.go.id/index.php/SCOG/issue/archive)*
2. Lembaran Publikasi Minyak dan Gas Bumi (LPMGB), vols. 7 (1973)- 59 (2025) (29)
(formerly called Lembaran Publikasi Lemigas)
(most of volumes online at: *http://journal.lemigas.esdm.go.id/index.php/LPMGB/issue/archive*)

4. LPPM ITATS (LPPM Institut Teknologi Adhi Tama Surabaya) (Research and Community Service Institute, Adhi Tama Institute of Technology Surabaya)

1. Journal of Earth and Marine Technology (JEMT), vols. 1 (2020)- 5 (2025) (9)
(online at: https://ejurnal.itats.ac.id/jemt/issue/archive)

5. MARINE GEOLOGICAL INSTITUTE OF INDONESIA (MGI), (Puslitbang Geologi Kelautan), Bandung
- Website: *https://www.mgi.esdm.go.id*

1. Bulletin of the Marine Geological Institute (1985-1996?) (14)
2. Bulletin of the Marine Geology (BoMG) (1997-2025) (65)
(vols. 22-40 online at: *https://ejournal.mgi.esdm.go.id/index.php/bomg/issue/archive)*
3. Jurnal Geologi Kelautan (JGK; Journal of Marine Geology; vols. 1-22, 2003-2024) (62)
(online at: *http://ejournal.mgi.esdm.go.id/index.php/jgk/issue/archive*)

6. NATIONAL ARCHAEOLOGY RESEARCH INSTITUTE (ARKENAS; Pusat Penelitian Arkeologi Nasional), Jakarta

- Successor institute of the *Oudheidkundige Dienst in Nederlandsch-Indie* (1913-1942); numerous name changes since 1942

1. AMERTA, Jurnal Penelitian dan pengembangan Arkeologi (vols. 1-39; 1985-2021) (7)
   (online at: *https://jurnalarkeologi.kemdikbud.go.id/index.php/amerta/issue/archive*)
2. PURBAWIDYA, Jurnal Penelitian dan Pengembangan Arkeologi (Balai Arkeologi Jawa Barat) (2)
   (vols. 1-10, 2012-2021)
   (online at: *https://purbawidya.kemdikbud.go.id/index.php/jurnal/issue/archive*)

7. PUSAT TEKNOLOGI BAHAN GALIAN NUKLIR (BATAN), Jakarta

- National Nuclear Energy Agency of Indonesia/ Technology Center for Nuclear Minerals

1. EKSPLORIUM- Buletin Pusat Pengembangan Bahan Galian Nuklir (vols. 32-46; 2011-2025) (27)
   (online at: *https://ejournal.brin.go.id/eksplorium/issue/archive)*

8. PUSAT VULKANOLOGI DAN MITIGASI BENCANA GEOLOGI (PVMBG), Bandung
(Center for Volcanology and Geological Hazard Mitigation;CVGHM); 1n 1919-1941 Netherlands East Indies Volcanological Survey, then Direktorat Vulkanologi, Volcanological Survey of Indonesia-(VSI), etc.; online at: *https://vsi.esdm.go.id/)*

- Series of geologic maps of major volcanoes online at: *https://vsi.esdm.go.id/gallery/index.php?/category/3*

1. Bulletin of the Volcanological Survey of Indonesia (1961-) (9)
   (and successor journals Berita Gunung Berapi (1952- ?), Berita Berkala Vulkanologi, etc.)
2. Buletin Vulkanologi dan Bencana Geologi (BVBG) (since 2006) (no online presence?) (0)

9. PUSLITBANG TEKNOLOGI MINERAL DAN BATUBARA (TEKMIRA), Bandung
(Center for Mineral and Coal Technology)

1. Jurnal Teknologi Mineral dan Batubara (vols. 1-19; 2005-2023) (8)
   (2009 and later issues online at: *https://jurnal.tekmira.esdm.go.id/index.php/minerba/issue/archive*)
   ("could not be reached", 1/2023)
2. Indonesian Mining Journal (vols. 1-27; 1998-2024) (39)
   (2005 and later issues online at: *http://jurnal.tekmira.esdm.go.id/index.php/imj/issue/archive*)

XIV.3. Indonesian Professional Geoscientists Associations

There are eight or more main professional geoscientists associations in Indonesia, which publish or published at least 21 geoscience-related journals or regular Convention proceedings or Special Publications series.

1. INDONESIAN ASSOCIATON OF GEOLOGISTS (IAGI) (Ikatan Ahli Geologi Indonesia), Jakarta
Website: *https://www.iagi.or.id/new/system/index.php* (partly restricted, members only access)

1. Proceedings Annual IAGI Conventions (Pertemuan Ilmiah Tahunan IAGI xx) (since 1971) (752)
   (many papers online, but not easy to find behind the 'membership wall')
2. Warta IAGI, Berita IAGI (newsletter, popular magazines; discontinued?) (0)
3. Geologi Indonesia (since 1970s?) (same as below?) (56)
4. Majalah Geologi Indonesia (MGI) (since ~1974?) (73)
5. IAGI Journal (vol. 1, 2021) (8)
   (only one year online at: *https://journal.iagi.or.id/index.php/IAGIJ/issue/archive*)
6. IAGI Special Publications (hard to find; no listings or ordering information online)

2. INDONESIAN ASSOCIATION OF GEOPHYSICISTS (HAGI) (Himpunan Ahli Geofisika Indonesia),
Website: *www.hagi.or.id/*

1. Proceedings of Annual HAGI Conventions, since 1973 (hard to find) (30)
   (nothing online at: *https://library.hagi.or.id/*)
2. Jurnal Geofisika (1-22; 2003-2024) (3)
   (selected volumes online at: *https://jurnal-geofisika.or.id/index.php/jurnal-geofisika/issue/archive*)

3. INDONESIAN ASSOCIATION OF SEDIMENTOLOGISTS (FOSI- IAGI), Jakarta
Sub-group of IAGI; Website: *www.iagi.or.id/fosi/*

1. Berita Sedimentologi (Indonesian Journal of Sedimentary Geology), (1-51; 1996-2025) (164)
(all volumes online at: *https://journal.iagi.or.id/index.php/FOSI/issue/archive*)

4. INDONESIAN PETROLEUM ASSOCIATION (IPA), Jakarta
Website: *www.ipa.or.id*

1. Proceedings of xx Annual Conventions IPA (1-47; 1972-2024) (1222)
(papers online at IPA website and AAPG Datapages; both by subscription only)
2. IPA Special Publications, Special Volumes (9)
3. IPA Fieldtrip Guidebooks (25)
4. Indonesia Oil and Gas Fields Atlas (8)
5. IPA Short Courses (generally unpublished)

5. INDONESIAN SOCIETY OF ECONOMIC GEOLOGISTS (MGEI), Jakarta
(Masyarakat Geologi Ekonomi Indonesia. Subdivision of IAGI. Online at: *http://mgei-iagi.org/)*)

1. Annual MGEI conventions (since 2009)
2. Geologi Ekonomi Indonesia (since 2009)
3. Indonesian Journal of Economic Geology (IJEG), vol. 1-2 (2021; only two issues (both 1-1)?) (8)
(online at: *https://journal.iagi.or.id/index.php/IJEG/issue/archive*)

6. INDONESIAN SOCIETY FOR KNOWLEDGE AND HUMAN DEVELOPMENT (Insight Society)

1. International Journal on Advanced Science, Engineering and Information Technology (IJASEIT) (10)
(Padang State Polytechnic; Politeknik Negeri Padang) (vols. 1-15, 2011-2025)
(online at: *https://ijaseit.insightsociety.org/*)

7. INDONESIAN SOCIETY OF PETROLEUM GEOLOGISTS (ISPG- IAGI)

1. Proceedings of ISPG Research Forums, 1-6 (2017-2023) (6)

8. INDONESIAN SOCIETY OF PETROLEUM ENGINEERS (IATMI); Ikatan Ahli Teknik Perminyakan Indonesia), Jakarta

- Website: *https://iatmi.or.id/*

1. Jurnal Teknologi Minyak dan Gas Bumi (2009?- now) (0)
(hard to find; some issues online at: *www.iatmi.or.id/assets/bulletin/pdf/JTMGB/*)
2. Annual IATMI Conventions, often jointly with IAGI, HAGI, etc. (157)

XIV.4. Indonesian Universities/ Academic institutes

There are about 35 or more universities in Indonesia with a Geoscience or Geological Engineering program that regularly publish their own journals with geoscience or geological engineering papers. Thirty-one of these Indonesian geoscience departments have been identified, with a total of ~65 journals/ periodicals.
Older issues of these academic journals used to be notoriously hard to find, but today, most schools have well-organized websites with Open-Access Archives of digital papers (but not all: ITB!).

1. INSTITUT TEKNOLOGI BANDUNG (ITB), Bandung

- Library website: *http://digilib.batan.go.id/;* restricted access*; also at: http://isisnetwork.lib.itb.ac.id/)*

1a. Buletin Geologi, ITB (vols. 1-42; 1980-2015) (57)
Formerly known as: Buletin Departemen Teknik Geologi ITB (1976?-?) and
Buletin Jurusan Geologi ITB. (7)
1b. Bulletin of Geology, vols. 1-9; 2017-2025) (31)
(online at: *https://buletingeologi.com/index.php/buletin-geologi/issue/archive*)
2. Contributions Department of Geology, Institute of Technology Bandung (~1960-1968 (22)
3. Jurnal Teknologi Mineral (JTM) (Journal of Mineral Technology, ITB) (1994-) (28)
(abstracts 1994-2007 online at: *www.fttm.itb.ac.id/jtm/index.php)*

(volumes 2009-2012 online at: *http://idci.dikti.go.id/pdf/JURNAL/JTM/)*

4. Journal of Mathematical and Fundamental Sciences (JMFS) (1961-2024); (11)
(includes some geology papers, mainly in older issues)
most of vols. 1-55 (1961-2024) online at: *https://journals.itb.ac.id/index.php/jmfs/issue/archive*)
Formerly known as:3c. ITB Journal of Science (2008-2012), and as:
3b. Proceedings ITB Science and Technology (2003-2007), and as:
3a. Proceedings Institut Teknologi Bandung (ITB) (1961-2002) (15)

5. Journal of Engineering and Technological Sciences (JETS) (1961- 2023) (4)
(very little geology). Formerly known as: ITB Journal of Engineering Science (2007- 2012)
. and before that as Proceedings ITB on Engineering Science (2003-2007)
(online at: *https://journals.itb.ac.id/index.php/jets/issue/archive* and *https://jets.itb.ac.id/jets*)

2. INSTITUT SAINS & TEKNOLOGI AKPRIND, Yogyakarta
- Jurusan Teknik Geologi website: *https://geologi.akprind.ac.id/*

1. Jurnal Teknologi Technoscientia (vols. 1-16, 2008-2024) (not much geology) (6)
(online at: *https://ejournal.akprind.ac.id/index.php/technoscientia/issue/archive*)

3. INSTITUT TEKNOLOGI NASIONAL YOGYAKARTA (ITNY), Yogyakarta
- Lembaga Penelitian, Pengabdian Masyarakat dan Inovasi (LPPMI)

1. Kurvatek, Energy Management and sustainable environmental (vols. 1-8, 2016-2023) (2)
(online at: *https://journal.itny.ac.id/index.php/krvtk/issue/archive*)

4. INSTITUT TEKNOLOGI SUMATRA (ITERA), Lampung, South Sumatra

1. Journal of Science and Applicative Technology (JSAT) (vols. 1-8, 2018-2024) (1)
(online at: *https://journal.itera.ac.id/index.php/jsat/issue/archive*)

5. IPB (INSTITUT PERTANIAN BOGOR) UNIVERSITY, Bogor

1. Jurnal Ilmu dan Teknologi Kelautan Tropis (JITKT) (Journal of Tropical Marine Science and Technology (vols. 1-16, 2009-2024) (10)
(online at: *https://journal.ipb.ac.id/index.php/jurnalikt/issue/archive*)
(mainly marime biology topics, also some micropaleontology)

6. SEKOLAH TINGGI NASIONAL (STTNAS), Yogyakarta

1. Prosiding Seminar Nasional RETII
(periodic seminars 8-12 (2013-2017) online at: *https://journal.sttnas.ac.id/ReTII/issue/archive)*

7. SEKOLAH TINGGI TEKNOLOGI MIGAS (STTMIGAS), Balikpapan

1. PETROGAS Journal of Energy and Technology (vols. 1-7, 2019-2025) (1)
(online at: *https://ejournal.sttmigas.ac.id/index.php/petrogas/issue/archive*)
(mainly oilfield technology, very few geology papers)

8. UNIVERSITAS BANGKA BELITUNG (UBB), Dept. of Mining Engineering, Bangka

1. Jurnal Promine (Jurnal Ilmiah Jurusan Teknik Pertambangan), vols. 1-9, 2013-2021) (3)
(online at: *https://journal.ubb.ac.id/index.php/promine/issue/archive*)
(all papers in Bahasa Indonesia, and mainly of geotechnical nature)

9. UNIVERSITAS DIPONEGORO (UNDIP), Semarang
- Repository of geology theses at: *http://eprints.undip.ac.id/view/subjects/QE.html*

1. Jurnal Geosains dan Teknologi (vols. 1-7, 2018-2024) (5)
(online at: *https://ejournal2.undip.ac.id/index.php/jgt/issue/archive*)
2. Geological Engineering E-Journal (vols. 1-6, 2012-2014) (no longer active?) (2)
(online at: *https://ejournal3.undip.ac.id/index.php/geologi/issue/archive*)
3. Jurnal Ilmu Lingkungan (Journal of Environmental Science) (vols. 1-21, 2002-2023) (1)
(vols. 9-21 online at: *https://ejournal.undip.ac.id/index.php/ilmulingkungan/issue/archive*)

4. Jurnal Kelautan Tropis (Tropical Marine Journal) (vols. 18-27 (2015-2024)
(online at: *https://ejournal2.undip.ac.id/index.php/jkt*)

10. UNIVERSITAS GADJAH MADA (UGM), Yogyakarta
- Library website: *http://i-lib.ugm.ac.id/jurnal/* or *http://lib.geologi.ugm.ac.id/web/*
- Archive of papers: *https://repository.ugm.ac.id/*

1. Jurnal Teknik Geologi (2013-2014; no longer active?) (5)
(online at: *http://lib.geologi.ugm.ac.id/ojs/index.php/geo/issue/archive)*
2. Journal of Southeast Asian Applied Geology (vols. 1-7, 2009-2015); (23)
2a. continued as Journal of Applied Geology (JAG) (vols. 1-10, 2016-2025) (22)
(online at: *https://jurnal.ugm.ac.id/jag/issue/archive)*
3. Journal of Geospatial Information Science and Engineering (vols. 1-6, 2018-2023) (1)
(online at: *https://jurnal.ugm.ac.id/jgise/issue/archive*)
4. Indonesian Journal of Chemistry (IJC) (since 2001) (3)
(online at: *https://jurnal.ugm.ac.id/ijc/issue/archive*)
5. Indonesian Journal of Geography (IJG) (vols. 16 55, 1986- 2023) (5)
online at: *https://jurnal.ugm.ac.id/ijg/issue/archive*)
6. Journal of Tropical Biodiversity and Biotechnology (JTBB) (vols. 1-9/4, 2016-2024) (6)
(online at: *https://journal.ugm.ac.id/jtbb/issue/archive*) (mainly biology papers)
7. Media Teknik (vols. 1-30?, ~1978-2006?) (13)
(after 2006 Forum Teknik? 'Engineering Forum' discontinued after vol. 37 (2016)
8. Proceedings of (annual) Seminar Nasional Kebumian, Yogyakarta (55)

11. UNIVERSITAS HALU OLEO, Kendari, Sulawesi

1. Jurnal Rekayasa Geofisika Indonesia (JRGI; vols. 1-4, 2019-2022). (0)
(online at: *http://ojs.uho.ac.id › index.php › jrgi*)
2. Ophiolite: Jurnal Geologi Terapan (vol. 1-6, 2019-2024) (3)
(vols. 1-4 (2019-2022) online at: *https://ojs.uho.ac.id/index.php/Ophiolite/issue/archive*)
(vols. 5-6 (2023-2024) online at: *https://ophiolite.uho.ac.id/index.php/journal/issue/archive)*

12. UNIVERSITAS HASANUDDIN (UNHAS), Makassar, South Sulawesi
- Website: *http://repository.unhas.ac.id/*

1. Jurnal Penelitian Geosains (Teknik Geologi Universitas Hasanuddin), vols. 1-11 (2004- 2015?) (7)
(vols. 9-12 online at: *https://eng.unhas.ac.id/geologi/id/page/10811205/jurnal-geosains.html)*
2. Jurnal Penelitian Enjiniring (JPE), Fakultas Teknik, Universitas Hasanuddin (vols. 1-25, 1997-2021) (3)
(vols 20-25 online at: *https://cot.unhas.ac.id/journals/index.php/jpe/issue/archive*)
3. International Journal of Engineering and Science Applications (IJEScA, vols. 1-4 (since 2014)
(online at: *http://pasca.unhas.ac.id/ojs/index.php/ijesca/issue/archive*)
4. Jurnal Geocelebes (Dept. of Geophysics, Universitas Hasanuddin (vols. 1-9, 2017-2025) (8)
(online at: *https://journal.unhas.ac.id/index.php/geocelebes/issue/archive*)
5. Walennae (Jurnal Arkeologi Sulawesi) (vols, 1-21, 1998-2023) (1)
(online at: *https://walennae.unhas.ac.id/index.php/walennae/issue/archive*)

13. UNIVERSITAS INDONESIA (UI), Dept. Geoscience, Depok, West Java

1. Jurnal Geosains Terapan (Applied Geoscience Journal) (vols. 1-5, 2015-2022) (4)
(online at: *https://geosainsterapan.id/index.php/id/issue/archive*)

14. UNIVERSITAS ISLAM RIAU (UIR), Dept. Geological Engineering, Pekanbaru, Sumatra

1. Journal of Geoscience, Engineering, Environment and Technology (JGEET) (vols. 1-10; 2016-2025) (65)
*(*online at: *https://journal.uir.ac.id/index.php/JGEET/issue/archive)*
2. Journal of Earth Energy Engineering (J-E3) (vols. 1-11, 2012-2022)
*(*online at: *https://journal.uir.ac.id/index.php/JEEE/issue/archive)*

15. UNIVERSITAS JEMBER (UNEJ), Fakultas Teknik, Sumbersari, East Java

1. Jurnal Teknologi Sumberdaya Mineral (JENERAL) (vols. 1-3, 2020-2022) (1)
(online at: *https://jurnal.unej.ac.id/index.php/JENERAL/issue/archive*)

16. UNIVERSITAS JENDERAL SOEDIRMAN (UNSOED), Faculty of Engineering, Purwokerto, Java
1. Jurnal Ilmiah Dinamika Rekayasa (vols. 1-18, 2005-2022 +2025) (11)
*(*online at: *https://jurnaldinarek.id/index.php/jidr/issue/archive)*

17. UNIVERSITAS KHAIRUN (UNJHAIR), Fakultas Teknik, Kota Ternate, Maluku Utara
1. Jurnal GEOMining (Teknik Pertambangan Unkhair) (vols. 1-4, 2020-2023) (3)
(online at: *https://ejournal.unkhair.ac.id/index.php/geomining/issue/archive*)

18. UNIVERSITAS KUTAI KARTANEGARA (UNIKARTA), Mining Engineering, Tenggarong, East Kalimantan
1. Jurnal Geologi Pertambangan (JGP) (Mining Geology Journal) (vols. 1-30, ??- 2024) (0)
(vols. 14-30 (2014-2024) online at: *https://ejurnal.unikarta.ac.id/index.php/jgp/issue/archive*)

19. UNIVERSITAS LAMBUNG MANGKURAT (ULM), Mining Engineering, Banjarbaru, SE Kalimantan
1. Jurnal Geosapta (Geosains untuk Aplikasi Tambangan) (vols. 1-10, 2015-2024) (6)
(online at: *https://ppjp.ulm.ac.id/journal/index.php/geosapta/issue/archive*)
2. EnviroScienteae (1)
(online at: *https://ppjp.ulm.ac.id/journal/index.php/es/issue/archive*) (vols. 7 (2011)- 20 (2024)

20. UNIVERSITAS LAMPUNG (UNILA), Engineering Faculty, Bandar Lampung, S Sumatra
1. Jurnal Geofisika Eksplorasi (JGE) (vols. 1-11, 2015-2025) (0)
(online at: *https://jge.eng.unila.ac.id/index.php/geoph/issue/archive)*

21. UNIVERSITAS MATARAM (UNRAM), Mataram, Lombok, West Nusa Tenggara
1. Jurnal Penelitian Pendidikan IPA (JPPIPA) (3)
(online at: *https://jppipa.unram.ac.id/index.php/jppipa/issue/archive*)

22. UNIVERSITAS MULAWARMAN (FT UNMUL), Teknik Geologi, Samarinda, E Kalimantan
1. Jurnal Teknik Geologi: Jurnal Ilmu Pengetahuan dan Teknologi (vols. 1-6, 2018-2023) (1)
(online at: *http://e-journals.unmul.ac.id/index.php/TG/issue/archive)*
2. Jurnal Teknologi Mineral FT UNMUL (vols. 1-12, 2013-2024)
(vols. 4-12 online at: *https://e-journals.unmul.ac.id/index.php/TM/issue/archive*)
3. Jurnal Geosains Kutai Basin (vols. 1-8/1, 2018-2025) (1)
(online at: *https://jurnal.fmipa.unmul.ac.id/index.php/geofis/issue/archive*)
(mainly student papers, in Bahasa Indonesia)

23. UNIVERSITAS MUSLIM INDONESIA (UMI), Fakultas Teknologi Industri, Makassar, S Sulawesi
1. Jurnal Geomine (vols. 1-12, 2015-2024; mining journal with some geology) (8)
(online at: https://jurnal.teknologiindustriumi.ac.id/index.php/JG/issue/archive)
(vols. 11-12 online at: https://jurnal.fti.umi.ac.id/index.php/JG/issue/archive)

24. UNIVERSITAS NEGERI GORONTALO (UNG), Dept. Earth Science and Technology, Gorontalo, N Sulawesi
1. Jambura Geoscience Review (JGEOSREV) (vols. 1-6/1, 2019-2024) (5)
(online at: https://ejurnal.ung.ac.id/index.php/jgeosrev/issue/archive)

25. UNIVERSITAS PADJADJARAN (UNPAD), Faculty of Geological Engineering, Bandung
1. Bulletin of Scientific Contribution, vols. 1-23 (2003-2025) (79)
(most papers of volumes 3/2-22 online at: https://jurnal.unpad.ac.id/bsc/issue/archive)
2. Journal of Geological Sciences and Applied Geology (vols. 1-8-1, 2016- 2024) (11)
(vols. 2-8 (2017-2024) online at: https://jurnal.unpad.ac.id/gsag/issue/archive)

3. Padjadjaran Geoscience Journal (vols. 1-9 (2017-2025) (4)
(online at: https://jurnal.unpad.ac.id/geoscience/issue/archive
(mainly brief student papers, in Bahasa Indonesia)

26. UNIVERSITAS PAPUA, Fakultas Teknik Pertambangan dan Perminyakan, Manokwari, W Papua
1. INTAN Jurnal Penelitian Tambang, vols. 1-7 (2018-2024; mainly mining technology journal) (2)
(online at: *https://jurnal-intan.ac.id/index.php/intan/issue/archive*)

27. UNIVERSITAS PEMBANGUNAN NASIONAL "VETERAN" (UPN), Yogyakarta
1. Jurnal Ilmiah Magister Teknik Geologi (MTG; 2008- 2022) (15)
2. Jurnal Mineral Energi dan Lingkungan (vol. 1, 2017-) (3)
(online at: *http://jurnal.upnyk.ac.id/index.php/JMEL/issue/archive)*
3. Journal Techno (Jurnal Ilmu Pengetahuan dan Teknologi) (vol. 1, 2015-) (4)
(parts online at: *http://jurnal.upnyk.ac.id/index.php/teknoslppm/issue/archive)*
4. Journal of Exploration Geophysics and Earth Science (since 2022; no issues published online yet?)
(online at: *http://jurnal.upnyk.ac.id/index.php/jeges/index*)
5. Jurnal Ilmu Kebumian Teknologi Mineral (JIK TekMin) (2015-2026?) (5)
(online at: *http://jurnal.upnyk.ac.id/index.php/JIKTekMin/issue/archive*)
(previously Buletin Teknologi Mineral (BTM); 1997?-) (not online?)
6. Jurnal Ilmiah Geologi PANGEA (vols. 1-12, 2014-2025) (2)
(online at: *https://jurnal.upnyk.ac.id/index.php/jig/issue/archive*)
(mainly student papers, in Indonesian)
7. Repository of geological thesis summaries: *http://eprints.upnyk.ac.id/view/subjects/QE.html*

28. UNIVERSITAS PENDIDIKAN INDONESIA (UPI), Bandung
1- Indonesian Journal of Science & Technology (IJoST), since 2016.
(only few geoscience papers; online at: *https://ejournal.upi.edu/index.php/ijost/issue/archive*)

29. UNIVERSITAS SAM RATULANGI (UNTAD), Faculty of Marine Science, Manado
1. Jurnal Pesisir dan Laut Tropis (since 2013) (2)

30. UNIVERSITAS TADULAKO (UNSRAT), Palu, Sulawesi
1. Tadulako Science andTechnology Journal (TSJ), (vols. 1-5, 2020-2024) (1)
(very little geoscience; online at: *https://bestjournal.untad.ac.id/index.php/sciencetech/issue/archive*)

31. UNIVERSITAS TRISAKTI (USAKTI), Jakarta
1. MINDAGI (Buletin Ilmiah Mineral dan Energi) (vol. 1, 2007- now) (11)
(online at: *https://www.trijurnal.lemlit.trisakti.ac.id/index.php/mindagi/login)* (registration required)
2. Petro- Jurnal Ilmiah Teknik Perminyakan (vols. 1-10, 2014-2021)
(online at: *https://www.trijurnal.lemlit.trisakti.ac.id/index.php/petro/issue/archive)*
3. Journal of Geoscience Engineering & Energy (JOGEE) (vol.s 1-6, 2020-2025) (3)
(all student papers, in Indonesian)
(online at: *https://e-journal.trisakti.ac.id/index.php/jogee/issue/archive)*
4. Indonesian Mining and Energy Journal (IMEJ) (vols. 1-7, 2018-2024) (0)
(mainly mining technology; online at: *https://e-journal.trisakti.ac.id/index.php/imej/issue/archive)*

INDONESIA- OTHERS
1. Journal of Geology and Exploration (vols. 1-5, 2022-2025) (1)
(Insight Publisher, Makassar; mainly 'student papers', with not much new?)
online at: *https://ejournal.insightpublisher.com/index.php/JGE/issue/archive*)
2. Indonesian Journal of Earth Sciences (InJoES) (since 2021) (1)
(MO.RI commercial publishers; Name misleadingly similar to 'Indonesian Journal on Geoscience (IJOG)', but >90% of papers are not about Indonesia)
(online at: https://journal.moripublishing.com/index.php/injoes/issue/archive)

XIV.5. Circum-Indonesia and International not-for-profit geoscience journals

Below is a listing of 'not-for-profit' international geoscience journals published by organizations based outside Indonesia, but with journals that periodically feature geoscience content about Indonesia/ SE Asia:
- >100 journals and conference series published by 49+ prominent international geoscience organizations;
- 57 additional journals or conference series from 11 countries.

In brackets are the number papers in each of these journals that was captured in this edition of the Bibliography. In alphabetical order:

1. ACADEMIE DES SCIENCES, PARIS- FRANCE
1. Comptes Rendus de l' Academie des Sciences- IIA (1835-2001) (78)
2. Comptes Rendus Palevol (published by Elsevier) (25)
3. Comptes Rendus Geoscience (2002 rename of (1); in 2002-2019 by Elsevier) (16)
   (online at: *https://comptes-rendus.academie-sciences.fr/geoscience/journals/CRGEOS/*)
4. Memoires de l' Academie des Sciences, Paris (since 1796) (2)

2. AMERICAN ASSOCIATION OF PETROLEUM GEOLOGISTS (AAPG), Tulsa, USA
- Selected papers and conference abstracts online (open access) at: *www.searchanddiscovery.net*
- Online access to AAPG, IPA, SEAPEX papers via *http://payperview.datapages.com/data/open/ppv.do* (subscription required)

1. AAPG Bulletin (180)
2. AAPG Memoirs (51)
3. AAPG Special Publications, AAPG Special Volumes, etc. (8)
4. AAPG International Conference Abstracts (113)
5. AAPG Annual Convention Abstracts (41?)

3. AMERICAN GEOPHYSICAL UNION (AGU), Washington D.C., USA
- Website: *https://www.agu.org/*

1. Chinese Journal of Geophysics (English version (2000-2018) (3)
2. EOS Transactions (AGU newsletter) (21)
3. Geochemistry, Geophysics, Geosystems (85)
4. Geophysical Research Letters (114)
5. Journal of Geophysical Research (: Solid Earth, : Earth Surface, etc.) (270)
6. Paleoceanography (16)
7. Tectonics (145)

4. ASEAN COUNCIL ON PETROLEUM AND ENERGY (ASCOPE)
(Regional platformm of national oil companies in 10 ASEAN member countries)
1. ASCOPE conferences since 1975, until now (2025) (32)

5. AUSTRALASIAN INSTITUTE OF MINING AND METALLURGY (AusIMM), Melbourne
1. AusIMM Monographs, Conference proceedings, etc. (153)
- Website: *https://www.ausimm.com/insights-and-resources/resources/ausimm-digital-library/*
(Australia- PNG mining-focused; subscription required for access)

6. AUSTRALIAN INSTITUTE OF GEOSCIENTISTS (AIG), NSW
1. Bulletin of the Australian Institute of Geoscientists (AIG Bulletin) (since 1983) (16)
   (online at: *https://www.aig.org.au/library/publications/aig-bulletins/*)

7. AUSTRALIAN PETROLEUM PRODUCTION & EXPLORATION ASSOCIATION (APPEA)
- Petroleum interest group, first established as APEA in 1959, with Annual Conferences

1. Australian Petroleum Exploration Association (APEA) Journal (1961-1995) (74)
Renamed as:
1a. Australian Petroleum Production Exploration Association (APPEA) Journal, or
The APPEA Journal (1996-2022): (78)
1b. Journal of Australian Energy Producers (since 2023; CSIRO Publishers)
2. APEA/ APPEA Conference volumes

8. CCOP- COORDINATING COMMITTEE FOR GEOSCIENCE PROGRAMMES IN EAST AND SE ASIA (CCOP)

- United Nations geoscience program, based in, Bangkok, Thailand, with CCOP publications since 1967.
- Called UN ESCAP *Committee for Coordination of Joint Prospecting for Mineral Resources in Asian Offshore Areas* (CCOP) in 1966-1994; *Coordinating Committee for Coastal and Offshore Geosccience Programmes in East and Southeast Asia* in 1994-2001.
-- many publications online at: *https://ccop.asia/e-library*
- 2007 catalogue online at: *www.ccop.or.th/download/pub/list_pub.pdf*

1. Proceedings Annual Sessions CCOP (vols. 1-59; 1967-2024) (63)
2.-CCOP Technical Bulletin (vols. 1-32, 1969-1995) (75)
3. CCOP Technical Publications (61)
4. CCOP Newsletter (23)

9. CUSHMAN FOUNDATION FOR FORAMINIFERAL RESEARCH, Lawrence, Kansas, USA

1. Contributions from the Cushman Foundation for Foraminiferal Research (1950-1970) (12)
continued as: 1a. Journal of Foraminiferal Research (1971- now) (54)

10. DEPARTMENT OF MINERAL RESOURCES (DMR), Bangkok

- Numerous publications on geology of Thailand can be searched and downloaded from DMR Web Gateway at *www.dmr.go.th/main.php?filename=Library2015___EN*
- Website with additional geological information: *www.dmr.go.th/main.php?filename=web_en*

1. Thai Geoscience Journal (TGJ) (vols. 1-5, 2020-2024) (7)
(online at: *https://ph03.tci-thaijo.org/index.php/TGJ/issue/archive)*
2. Symposium volumes on Thailand Geology (many)

11. EUROPEAN GEOSCIENCES UNION (EGU)

1. Solid Earth (SE) (2010-2026) (6)
(online at: *https://www.solid-earth.net*)
2. Natural Hazards and Earth Systems Sciences (7)
(online at: *https://www.natural-hazards-and-earth-system-sciences.net/*)

12. GEOLOGICAL SOCIETY OF AMERICA (GSA), Boulder, CO, USA

- Website: *https://www.geosociety.org/*

1. GSA Bulletin (96)
2. GSA Special Papers (41)
3. GSA Memoirs (14)
4. Geology (GSA) (164)
5. GSA Today (4)
6. Geosphere (11)

13. GEOLOGICAL SOCIETY OF AUSTRALIA (GSA), Sydney, Australia

1. Journal of the. Geological Society of Australia (1953-1983)) (29)
2. Australian Journal of Earth Sciences (AJES; since 1984) (Taylor & Francis) (136)
3. Alcheringa: An Australasian Journal of Palaeontology (Taylor & Francis) (63)
4. Memoirs of the Association of Australasian Palaeontologists (AAP) (37)
(since 2015 renamed as: Australasian Palaeontological Memoirs .
5. Geological Society of Australia, Special Publications (7)

14. GEOLOGICAL SOCIETY OF INDIA (GSI), Bangalore, India
(Mainly for papers on Andaman- Nicobar Islands)
1. Journal of the Geological Society of India (34)
2. Memoirs of the Geological Society of India (3)
3 Journal of the Palaeontological Society of India (14)

15. GEOLOGICAL SOCIETY, LONDON, London, U.K.
- Journals and book publications online at: Lyell collection: (*www.lyellcollection.org)*
(with few exceptions, no open access)
1. Quarterly Journal of the Geological Society of London (vols 1-126; 1845-1970);
renamed to: Journal of the Geological Society, London (vols. 127-181; 1971-2024) (127)
2. Geological Society, London, Memoirs (84)
3. Geological Society, London, Special Publications (263)
4. Petroleum Geoscience (20)
5. Journal of Micropalaeontology (18)
6. Proceedings of the Geologists Association (10)
7. Geology Today (8)

16. GEOLOGICAL SOCIETY OF MALAYSIA (GSM), Kuala Lumpur, Malaysia
- Website *www.gsm.org.my/publications/biblio&index*
1. Bulletin of the Geological Society of Malaysia (vols. 1-80, 1968- 2025) (537)
(open access since 2021 and online at: *https://gsm.org.my/bulletin-of-the-geological-society-of-malaysia/*)
older issues at *https://gsmpubl.wordpress.com/category/bulletin/*
2. Warta Geologi (Newsletter Geological Society of Malaysia) (vols. 1-49, 1975-2025) (140)
(1975-2024 issues online at: *https://gsm.org.my/warta-geologi/*
3. Proceedings of the National Geoscience Conference (NGC) (Annual conferences since 1965) (21)
(several issues online at: *https://gsm.org.my/proceedings/*)
4. Proceedings Petroleum Geology Conference and Exhibition (PGCE), Kuala Lumpur) (43)
(33 annual GSM/ Petronas petroleum conferences from 1977 until Petronas/GSM withdrawal in 2013)
5. Proceedings Asia Petroleum Geoscience Conference & Exhibition (APGCE) (42)
(since 2015; restart of PGCE without GSM; annual conferences in Kuala Lumpur; Petronas/EAGE?)

17. GEOLOGICAL SOCIETY OF SOUTHEAST ASIA (GEOSEA)
(Consortium of Geological Societies of member countries Indonesia, Thailand, Philippines, Malaysia)
1. Regional Congress on Geology, Mineral and Energy Resources of SE Asia (GEOSEA) (251)
(18 Regional SE Asia Geoscience Conferences (1972- 2024), held every 3 years,
with hosting rotating between Geological Associations of four member countries)

18. GEOLOGICAL SOCIETY OF THE PHILIPPINES
- Website at: *https://geolsocphil.com/site/index*
1. The Philippine Geologist (since 1946) (continued as:
1a. Journal of the Geological Society of the Philippines (1950s-2008?) (67)

19. GEOLOGICAL SURVEY DEPARTMENT - North Borneo (1949-1968)
(in 1968 merged with Geological Survey Department of Peninsular Malaysia)
1a. Geological Survey Department, British Territories in Borneo, Kuching (1949-1963) (53)
(Bulletins, Memoirs, Reports, Annual Reports, etc.)
1b. Geological Survey of Malaysia, Borneo Region, Kuching (1963-1968) (28)
(Post-Independence Bulletins, Special Papers, Annual Reports, etc.)

20. GEOLOGICAL SURVEY OF MALAYA/ MALAYSIA - Peninsular Malaysia
(now Jabatan Mineral Dan Geosains Malaysia (Department of Mineral and Geoscience Malaysia)
many name changes before and after Malaya/ Malaysia Independence in 1957:

1a: (British) Geological Office. (1903-1927)
1b. Geological Survey Department, Federated Malay States (1927- 1948) (3)
1c. Geological Survey Department, Federation of Malaya (1948-1963) (3)
1d. Geological Survey of Malaysia (since 1963; 1968 merger with Borneo Region Geol. Survey) (47)
1e. Department of Mineral and Geoscience Malaysia (JMG) (since 1999) (6)
(District Memoirs, Bulletins, Reports, Maps, Annual Reports, etc.)

21. GEOLOGICAL SURVEY OF VIETNAM, Hanoi
1. Bulletin du Service Geologique de l'Indochine (~1898-1953; French colonial era) (10)
2. Memoires du Service Geologique de l'Indochine (1912-1924) (7)
3. Archives Geologiques du Vietnam (Annual publication, 1952-1975)-) (10)
3. Journal of Geology (Hanoi) (15)

22. GEOSCIENCE AUSTRALIA/ BUREAU OF MINERAL RESOURCES (BMR), Canberra
- Australian Bureau of Mineral Resources, Geology and Geophysics (BMR); since 1946;
- Renamed Australian Geological Survey Organisation (AGSO) in 1992, Geoscience Australia (GA) in 2001
- Website: *www.ga.gov.au*
- Extensive online data bases on Australian well data, well logs, geological reports, etc. Publications and Data search tool at: *https://ecat.ga.gov.au/geonetwork/srv/eng/search*

1. BMR Journal of Australian Geology and Geophysics (1976-1993), (47)
succeeded by AGSO Journal of Australian Geology and Geophysics (1993-2000) (16)
then merged with Geol. Soc. Australia into Australian Journal of Earth Sciences (see above)
(online at: *www.ga.gov.au/data-pubs/library/legacy-publications/journals*)
2. Bulletin of the Bureau of Mineral Resources Geology and Geophysics (1932-2001) (12)
(online at: https://www.ga.gov.au/data-pubs/library/legacy-publications/bulletins)
succeeded by AGSO Bulletin (7)

3. BMR/ AGSO Records since 1940s (many open file reports; incl. PNG, East Timor) (17)
(online at: *https://www.ga.gov.au/data-pubs/library/legacy-publications/records*)

23. INDO-PACIFIC PREHISTORY ASSOCIATION (IPPA, FEPA), Seattle, WA, USA
- Regional SE Asia archeology society, since 1953, 1976.
- initially as Far Eastern Prehistory Association (FEPA), with journal:

1. Asian Perspectives (since 1957; after 1972? no longer associated with FEPA, IPPA) (18)
In 1976 FEPA renamed to Indo-Pacific Prehistory Association (IPPA), with journals:
2. Bulletin of the Indo-Pacific Prehistory Association (vols. 1-33, 1979-2013) (17)
(online at: *https://journals.lib.washington.edu/index.php/BIPPA/issue/archive*)
2b. renamed 2014 as Journal of Indo-Pacific Archaeology (vols. 34-49, 2014-2025) (3)
(online at: *https://journals.lib.washington.edu/index.php/JIPA/issue/archive)*

24. INTERNATIONAL ASSOCIATION OF SEDIMENTOLOGISTS (IAS), legal base in Belgium
- Three main IAS journals, now managed by Wiley-Blackwell

1. Basin Research (co-published with EAGE) (30)
2. Sedimentology (21)
3. The Depositional Record (5)
(open access journal since 2015; online at: *https://onlinelibrary.wiley.com/loi/20554877)*
4. Special Publications (15?)

25. KOREAN SOCIETY OF ECONOMIC AND ENVIRONMENTAL GEOLOGY (KSEEG)
(online at: *https://www.kseeg.org*)
1. Economic and Environmental Geology (E2G) (since 1968) (16)

26. NATIONAL ACADEMY OF SCIENCES (NAS), Washington, D.C., USA
1. Proceedings of the National Academy of Sciences USA (PNAS) (39)

27. OCEAN DRILLING PROGRAM (DSDP, ODP, IODP), College Station, Tx, USA
- Information on worldwide deep sea drilling programs (but none ever allowed in Indonesian deep waters!)
- Website *www-odp.tamu.edu/*

1. Initial Reports Deep Sea Drilling Project (DSDP) Volumes 1-96 (1968- 1985) (24)
1a. Proceedings Ocean Drilling Program (ODP), Initial Reports (Legs 100-210; 1985-2003) (101)
1b. Proceedings International Ocean Discovery Program (IODP) (Legs 301-402; 2003-2024) (4)

28. PETROLEUM EXPLORATION SOCIETIES- AUSTRALIA (PESA, AEGC)
Australian Petroleum Exploration group(s), with Annual Coferences

1. Petroleum Exploration Society Australia Journal (PESA Journal) (since 1982) (19)
2. PESA News (9)
3. Proceeding PESA Symposium volumes (annual, many) (77)
3. Australian Exploration Geoscience Conference (AEGC), W Australian Basins Symposium (WABS))

29. ROYAL SOCIETY OF VICTORIA, Melbourne, Australia

1. Proceedings of the Royal Society of Victoria (34)

30. ROYAL SOCIETY OF WESTERN AUSTRALIA (RSWA), Perth, West Australia

1. Journal of the Royal Society of Western Australia (12)

31. SEISMOLOGICAL SOCIETY OF AMERICA (SSA), Albany, CA, USA
- Website: *https://www.seismosoc.org/publications/*

1. Seismological Research Letters (7)
2. Bulletin of the Seismological Society of America (13)

32. SOCIETE GEOLOGIQUE DE FRANCE (Geological Society of France, Paris)

1. Bulletin de la Societe Geologique de France (50)
2. Memoires de la Societe Geologique de France (16)
3. Compte Rendu Sommaire des Seances de la Societe Geologique de France (3)

33. SOCIETY FOR SEDIMENTARY GEOLOGY (formerly SEPM), Oklahoma, USA

1. Journal of Sedimentary Research (JSR) (36)
2. Palaios (23)
3. SEPM Special Publications (48)

34. SOCIETY OF ECONOMIC GEOLOGISTS (SEG), Littleton, CO, USA

1. Economic Geology (since 1905) (124)
2. SEG Discovery (2)

35. SOCIETY OF EXPLORATION GEOPHYSICISTS (SEG), Houston, TX

1. Geophysics (8)
2. Interpretation (SEG-AAPG) (since 2013) (10)
3. The Leading Edge (27)

36. SOCIETY OF PETROLEUM ENGINEERS (SPE)

1. SPE Asia Pacific Oil and Gas Conference and Exhibition (APOGCE), since 1989
(Proceedings of Annual Conferences in Asia-Pacific region since 1989; OnePetro paywall) (25)

37. SOUTHEAST ASIA PETROLEUM EXPLORATION SOCIETY (SEAPEX), Singapore
- Website: *www.seapex.org*

1. SEAPEX Offshore South East Asia Conferences (biannual since 1973) All SEAPEX conferences: (246)
- 1976-1994 SEAPEX Proceedings (online at: *www.seapex.org/press-list.php* (members only)
- 1974-2024 SEAPEX Proceedings (online through AAPG Datapages; members only)

2. SEAPEX Special Publications, Short courses
3. SEAPEX Press (quarterly newsletter) (20)

38. SOUTHEAST ASIA RESEARCH GROUP (SEARG), ROYAL HOLLOWAY, U.K.
(University of London, Egham, UK; since ~2023 significantly downsized and relocated to Edinburgh)
- Industry-sponsored University of London geoscience research consortium, active since the 1970's
- No dedicated geological journals. Website *http://searg.rhul.ac.uk/ (no longer exists?; 2025)*

39. UNIVERSITI KEBANGSAAN MALAYSIA (National University of Malaysia), Kuala Lumpur
1. Sains Malaysiana (vols. 1-53, 1971-2024) (43)
- general science journal with occasional geology papers)
(2010-2024 issues online at: *www.ukm.my/jsm/contents.html*)

40. UNIVERSITI TEKNOLOGI MALAYSIA (UTM), Kuala Lumpur
1. ASEAN Engineering Journal (vols. 1-14, 2011-2024) (6)
(Engineering journal with occasional geoscience papers; until 2017 geoscience paper were in Part C)
(online at: *https://www.ukm.my/jsm/contents.html)*

410. UNIVERSITY OF PAPUA NEW GUINEA (UPNG), Port Moresby
1. Science in New Guinea (since 1972) (9)

42. UNIVERSITY OF TOKYO PRESS, Tokyo, Japan
1. Geology and Palaeontology of Southeast Asia (1964-1984) (230)
(Significant 25 book series on paleontology of SE Asia (T. Kobayashi and R. Toriyama, eds.),
published for Japanese Association for Paleontological Research in Southeast Asia (APRSA);
- Total of >230 papers, ~80% on paleontology-biostratigraphy topics, spanning fossils from Cambrian-Quaternary age, mainly from Thailand, Malaysia, Indonesia, Philippines;
- Final volume 25 (1984) with 22 review papers summarizing knowledge of fossil groups in SE Asia.

43. U.S. GEOLOGICAL SURVEY (USGS), Denver, etc., USA
- Includes petroleum system studies on selected Indonesian basins; all USGS products Open Access.
- Website: *http://energy.cr.usgs.gov/oilgas/...*
1. U.S. Geological Survey (USGS) Professional Papers (29)
2. U.S. Geological Survey (USGS) Open File Reports (9)
3. U.S. Geological Survey (USGS) Fact Sheets (5)

44. MISCELLANOUS GEOSCIENCE JOURNALS- AUSTRIA
1. Austrian Journal of Earth Sciences (Austraian Geological Society; since 2004) (1)
- started as 1a. Mitteilungen der Geologischen Gesellschaft in Wien (Vienna) (1908-1974) (4)
1b. Mitteilungen der Osterreichischen Geologischen Gesellschaft (1975-2003) (8)
2. Annalen des Naturhistorischen Museums in Wien (4).
3. Beitrage zur Palaontologie Osterreichs (1)
4. Sitzungsberichte der Osterreichischen Akademie der Wissenschaften, Wien (Vienna) (2)
5. Verhandlungen/Jahrbuch der Kaiserlich-Koniglichen Geologischen Reichsanstalt, Vienna (10)
(later: Abhandlungen/Verhandlungen/ Jahrbuch der Geologischen Bundesanstalt, Wien) (7)

45. MISCELLANOUS GEOSCIENCE JOURNALS- CHINA
1. Acta Geologica Sinica (Geological Society of China) (English and Chinese Editions) (42)
2. Acta Oceanologica Sinica (10)
3. Acta Palaeontologica Sinica (7)
4. Acta Petrologica Sinica (4)
5. Chinese Science Bulletin (1966-2014) + 4a. Science Bulletin (Chinese Academy of Sciences) (22)
6. Journal of Stratigraphy (Nanjing, Chinese Academy of Sciences) (4)
7. National Science Review (China) (10)

8. Science China Earth Sciences (for Chinese Academy of Sciences) (12)
9. Science in China (15)

46. MISCELLANOUS GEOSCIENCE JOURNALS- FRANCE

1. Bureau Recherches Geologiques et Minieres (BRGM), Bulletins, Reports (14)
2. Geodiversitas (MNHM) (16)
3. Museum National d'Histoire Naturelle (MNHM), Paris: Theses, Memoires ?

47. MISCELLANOUS GEOSCIENCE JOURNALS- GERMANY

1. Mitteilungen aus dem Geologisch-Palaontologischen Institut der Universitat Hamburg (1969-2006) (12)
(including Mitteilungen aus dem Mineralogisch-Geologischen Staatsinstitut in Hamburg (1911-1933) and Mitteilungen aus dem Geologischen Staatsinstitut in Hamburg (1935-1968))
2. Zeitschrift der Deutschen Geologischen Gesellschaft, Berlin (since 1849) (39)
3. Zeitschrift fur Praktische Geologie, Berlin (since 1893 until 1944?) (11)

48. MISCELLANOUS GEOSCIENCE JOURNALS- ITALY

1. Bollettino della Societa Geologica Italiana (1882- 2021) (5)
(now Italian Journal of Geosciences)
2. Bollettino della Societa Paleontologica Italiana (since 1960) (5)
3. Rivista Italiana di Paleontologia, Rivista Italiana di Paleontologia e Stratigrafia (since 1895) (12)
4. Memorie di Scienze Geologiche, University of Padova, (21)

49. MISCELLANOUS GEOSCIENCE JOURNALS- JAPAN

1. Asian Paleoprimatology (Primate Research Institute, Kyoto 2000-2009) (8)
(online at: *https://repository.kulib.kyoto-u.ac.jp/communities/d0e27461-8661-4f33-8207-c2b288e07ca7)*
2. Bulletin of the Earthquake Research Institute (University of Tokyo) (5)
(online at: *https://repository.dl.itc.u-tokyo.ac.jp/*))
3. Bulletin of the National Science Museum, Tokyo + Memoirs (18)
4. International Journal of GEOMATE (Geotechnical-construction journal; since 2011) (7)
(online at: https://geomatejournal.com/geomate/issue/archive)
5. Japanese Journal of Geology and Geography (Tokyo, 1922-1975) (20)
6. Journal of Geography (Chigaku Zasshi) (Tokyo) (19)
(online at: *https://www.jstage.jst.go.jp/browse/jgeography/list/-char/en)*
7. Journal of the Geological Society of Japan, Tokyo (10)
8. Journal of Geosciences, Osaka City University (15)
9. Journal of the Japanese Association for Petroleum Technology (Tokyo, since 1933) (23)
10. Journal of Mineralogical and Petrological Sciences (13)
(Japan Association of Mineralogical Sciences; *www.jstage.jst.go.jp/browse/jmps/list/-char/en*)
11. Memoirs Faculty of Science, Kyushu University (15)
12. Mining Geology (Society of Mining Geologists of Japan, Tokyo; since 1951) (13)
13. Paleontological Research (Palaeontological Society of Japan) (30)
14. Proceedings of the Japan Academy (since 1945) (22)
preceded by 14a. Proceedings of the Imperial Academy (1913-1944) (6)
15. Science Reports of the Tohoku University, Sendai (7)
16. Transactions and Proceedings of the Paleontological Society of Japan (12)

50. MISCELLANOUS GEOSCIENCE JOURNALS- MALAYSIA

1. Earth Sciences Malaysia (ESMY) (Zibeline Int. Publishing) (2017-2024) (1)
(online at: *https://earthsciencesmalaysia.com/archive/*) (95% of papers from Nigeria, Pakistan!)
2. Geological Behavior (GBR) (Zibeline Int. Publishing) (2017-2024) (7)
(online at: *https://geologicalbehavior.com/archive/*)

51. MISCELLANOUS GEOSCIENCE JOURNALS- SWITZERLAND

1. Eclogae Geologicae Helvetiae (1888-2006) (51)

(online at: *https://www.e-periodica.ch/digbib/volumes?UID=egh-001)*
2. Schweizerische Mineralogische und Petrographische Mitteilungen (1921- 2005) (3)
(1+2 continued as:2a. Swiss Journal of Geosciences, since 2007) (1)
3. Schweizerische Palaontologische Abhandlungen (Basel) (1874-2010)
continued as 2a. Swiss Journal of Palaeontology (3)
4. Bulletin der Vereinigung Schweizerischer Petroleum-Geologen und -Ingenieure (5)
(online at: *https://www.e-periodica.ch/digbib/volumes?UID=vsp-002*)

52 MISCELLANOUS GEOSCIENCE JOURNALS- TAIWAN
1. Acta Geologica Taiwanica, Science Reports National Taiwan University (3)
2. Acta Oceanographica Taiwanica (2)
3. Bulletin of the National Museum Natural Science, Taipeh (8)
4. Memoir of the Geological Society of China (Taiwan) (4)
5. Terrestrial Atmospheric and Oceanic Sciences (TAO) (Chinese Geoscience Union, Taiwan) (14)
(online at: *http://tao.cgu.org.tw/index.php/articles/archive*)

53. MISCELLANOUS GEOSCIENCE JOURNALS- THAILAND
1. Journal of the Geological Society of Thailand (1975-2015) (34)
(since 2020 merged into Thai Geoscience Journal (TGJ) by DMR, Bangkok) (12)
2. Bulletin of Earth Sciences of Thailand (BEST) (2008-2024) (Chulalongkorn University (57)
(online at: *https://ph01.tci-thaijo.org/index.php/bestjournal/issue/archive*)
3. Journal of Science and Technology Mahasarakham University (12)
4. Numerous Conference volumes

54. ACADEMIC THESES (dozens of universities, in and outside Indonesia) (910)

55. CONFERENCE VOLUMES (in addition to the many professional societies conference series listed above)
1. IOP Conference Series: Earth and Environmental Science (220)
2. Journal of Physics: Conference Series (20)
3. E3S Web of Conferences (13)
4. EAGE (European Association of Geoscientists & Engineers) Conferences (66)
(Annual EAGE and other conferences, (APGCE, etc.); online at EarthDoc.org; no open access)

XIV.6. International Geoscience Journals- Commercial publishers

Below is a listing of nine leading international commercial publishers with 107 geoscience journals, plus an additional 23 miscellaneous international journals that may contain geoscience papers on Indonesia or surrounding areas.
Typically, some papers may be available in Open Access, but most are behind often expensive 'paywalls'.
In brackets are the number of papers from each of these that are listed in this Bibliography.

1. Cambridge University Press, Cambridge, U.K.
1. Geological Magazine (86)
2. Journal of Paleontology (journal of the Paleontological Society, USA) (82)
3. Quaternary Research (22)

2. Elsevier Publishing Co, Amsterdam, Netherlands
Many geoscience journals with regular or occasional contributions on geology of Indonesia/ SE Asia
- also publisher of numerous Eartth sciences textbooks.
- online at: *www.sciencedirect.com* (but generally behind paywall)
1. Applied Geochemistry (6)
2. Chemical Geology (54)

3. Deep Sea Research (18)
4. Earth History and Biodiversity (since 2024) (3)
5. Earth-Science Reviews (85)
6. Earth and Planetary Science Letters (200)
7. Geobios (34)
8. Geochimica Cosmochimica Acta (52)
9. Geodesy and Geodynamics (5)
10. Geosystems and Geoenvironment (for Ocean University of China) (since 2022) (11)
11. Global and Planetary Change (12)
12. Gondwana Research (for Int. Association for Gondwana Research; IAGR) (80)
13. International Journal of Coal Geology (44)
14. Journal of African Earth Sciences (5)
15. Journal of Geochemical Exploration (49)
16. Journal of Human Evolution (78)
17. Journal of Natural Gas Geoscience (China) (4)
18. Journal of Palaeogeography (for China University of Petroleum Beijing) (10)
19. Journal of Southeast Asian Earth Sciences (1986-1996) (177)
(continued as: 19a. Journal of Asian Earth Sciences (since 1997) (532)
20. Journal of Asian Earth Sciences: X (since 2019; mainly open access) (28)
21. Journal of Structural Geology (39)
22. Journal of Volcanology and Geothermal Research (140)
23. Lithos (105)
24. Marine Geology (104)
25. Marine Micropaleontology (68)
26. Marine and Petroleum Geology (90)
27. (Netherlands) Journal of Sea Research (for NIOZ) (43)
28. Ore Geology Reviews (60)
29. Palaeogeography, Palaeoclimatology, Palaeoecology (195)
30. Palaeoworld (for Nanking Institute of Geology Palaeontology) (34)
31. Physics of the Earth and Planetary Interiors (20)
32. Procedia Earth and Planetary Science (7)
33. Quaternary International (for INQUA) (67)
34. Quaternary Science Reviews (formerly by Pergamon Press) (58)
35. Review of Palaeobotany and Palynology (51)
36. Revue de Micropaleontologie (Paris) (16)
37. Science of the Total Environment (4)
38. Sedimentary Geology (59)
39. Tectonophysics (340)

3. Multidisciplinary Digital Publishing Institute (MDPI), Basel, Switzerland
(Publisher of online, open-access scientific journals since 1996; mixed reputation with peer reviews?)
1. Applied Sciences (since 2011) (8)
2. Geosciences (since 2011; at: *https://www.mdpi.com/journal/geosciences*) (26)
3. Journal of Marine Science and Engineering (since 2013; at: *https://www.mdpi.com/journal/jmse*) (4)
4. Minerals (since 2011; at: *https://www.mdpi.com/journal/minerals* (34)
5. Quaternary (since 2018; at: *https://www.mdpi.com/journal/quaternary*) (2)
6. Remote Sensing (since 2009; at: *https://www.mdpi.com/journal/remotesensing*) (6)
7. Resources (since 2012; at: *https://www.mdpi.com/journal/resources*) (1)

4. Oxford University Press (Oxford Academic), Oxford, U.K.
1. Geophysical Journal International (60)
2. Journal of Petrology (49)

5. Schweizerbart Science Publishers, Stuttgart, Germany

1. Courier Forschungsinstitut Senckenberg (18)
2. Geologisches Jahrbuch (multiple series) (61)
3. Geologica et Palaeontologica (3)
4. Neues Jahrbuch fur Mineralogie, Geologie Palaontologie (multiple series) (100)
5. Newsletters on Stratigraphy (11)
6. Palaeontographica (multiple series of classic paleontological monographs) (79)
7. Palaeontologie von Timor series (1914-1929) (19)
8. Senckenbergiana Lethaea (10)
9. Zeitschrift fur Geomorphologie (12)
10. Zentralblatt fur Mineralogie Geologie und Palaontologie (incl. Centralblatt fur MGP) (44)

6. Springer Verlag, Berlin, New York

Many geoscience journals with regular or occasional contributions on geology of Indonesia/ SE Asia. Also publisher of many geology/ geophysics Textbooks and Conference Proceedings.

1. Acta Geophysica (for Polish Academy of Sciences) (6)
2. Bulletin of Volcanology (started as Bulletin Volcanologique; IAVCEI, Napoli, since 1922) (77)
3. Carbonates and Evaporites (5)
4. Contributions to Mineralogy and Petrology (55)
5. Coral Reefs (Journal of the International Coral Reef Society) (21)
6. Earth, Planets and Space (EPS) (19)
7. Facies- Carbonate sedimentology and Paleoecology (1979- now) (22)
8. Geojournal (6)
9. Geologische Rundschau (Journal of the German Geological Society) (since 1910) (37)
   continued as: 9a. International Journal of Earth Sciences (~2000- now) (27)
10. Geo-Marine Letters (20)
11. Geoscience Letters (for Asia Oceania Geosciences Society (AOGS) (since 2014) (16)
12. Geosciences Journal (with Korean Geoscience Societies) (since 1997) (20)
13. Journal of Earth Science *(China)* (38)
14. Journal of Ocean University of China (3)
15. Journal of Petroleum Exploration and Production Technology (8)
16. Journal of Oceanology and Limnology (China) (5)
17. Marine Geophysical Research (29)
18. Mineralium Deposita (26)
19. Mineralogy and Petrology (16)
20. Natural Hazards (since 1989), (10)
21. Nature, Nature Physical Science (leading general science journal since 1869) (~110)
22. Nature Communications (27)
23. Nature Communications Earth & Environment (5)
24. Nature Geoscience (since 2008) (26)
25. Nature Scientific Reports (41)
26. Nature NPJ Natural Hazards (since 2024) (1)
27. Progress in Earth and Planetary Science (5)
28. Stratigraphy and Geological Correlation (for Russia Academy of Sciences) (6)

7. Taylor & Francis, U.K.

With lmited open access and steep download charges.

1. Exploration Geophysics (22)
2. Geodinamica Acta (3)
3. International Geology Review (41)
4. Journal of Vertebrate Paleontology (Society of Vertebrate Paleontology) (27)
5. Journal of Systematic Palaeontology (8)

8. Wiley-Blackwell (2007 merger of **John Wiley & Sons + Blackwell Publishing)**, New York.

Several international geoscience journals with regular or occasional contributions on geology of Indonesia/ SE Asia. Online for general for subscribers at: *https//onlinelibrary.wiley.com*

1. Earth Surface Processes and Landforms (10)
2. First Break (since 1983) (published for EAGE) (5)
3. Geological Journal (with Northwest University (China) (since 1951) (49)
4. Island Arc (since 1992) (55)
5. Journal of Biogeography (23)
6. Journal of Metamorphic Geology (24)
7. Journal of Petroleum Geology (JPG) (28)
8. Paleoceanography and Paleoclimatology (AGU) (8)
9. Resource Geology (74)
10. Terra Nova (20)

9. University of Chicago Press, Chicago, USA

1. The Journal of Geology *(not to be confused with other journals wit similar title)* (36?)

10. International Geoscience Journals- Others

Below are 22 additional international geoscience journals that occasionally or frequently contain papers about the geology/geophysics of Indonesia and surrounding areas.
In brackets are the number of papers from each of these journals listed in this Bibliography.

1. American Journal of Physical Anthropology (19)
2. American Journal of Science (17)
3. Annual Review of Earth and Planetary Sciences (California, USA) (12)
4. Frontiers in Earth Science (Swiss open access online journal since 2007) (42)
5. Frontiers in Ecology and Evolution (Swiss open access online journal since 2012?) (2)
6. Frontiers in Marine Science (8)
7. International Journal of Geology and Earth Sciences (IJGES) (Madrid) (4)
8. International Journal of Science and Research (IJSR) (India) (since 2022) (9)
   (online at: *https://www.ijsr.net/allvolumes.php*)
9. Iraqi Geological Journal (UIG, Baghdad, Iraq) (16)
   (online at: *https://igj-iraq.org/igj/index.php/igj/issue/archive)*
10. Journal of Geoscience and Environment Protection (Scientific Research Publishing) (since 2013) (3)
11. Micropaleontology (Micro Press, New York) (55)
12. Modern Quaternary Research in Southeast Asia (A.A. Balkema, Rotterdam) (58)
    (older series of papers; none online)
13. Oil and Gas Journal (Nashville, TN, USA; since 1902) (32)
14. Open Journal of Geology (Scientific Research Publishing) (2014-2024) (9)
    (open access at: *https://www.scirp.org/journal/ojg*)
15. Overseas Geology and Mineral Resources (British Geological. Survey/ IGS, London) (6)
    (online at: *https://webapps.bgs.ac.uk/data/Publications/series.html?code=RH*)
16. Palaeontologia Electronica (4)
    (online journal since 1997, at *https://palaeo-electronica.org/content/*)
17. Philosophical Transactions of the Royal Society (London) (14)
